Topic: 3 Message: 3

Hi all - At the moment we have 8 folks signed up to the reflector, 6 stateside, a 4X, and one with a .ee domain (don't know where that is, but am curious).
FYI, I got an e-mail from Jim, K1IR with some info. There is now a discussion area on the Acom Intl Web site (www.hfpower.com).
Also, Jim informs me he is in the process of setting up an Acom reflector on contesting.com. Personally, I think it's silly to have more than 1 reflector for this topic, so once his reflector is up and running, I'll close this one down (letting every know first).

From: Barry Kutner
Topic: 4 Message: 4

Hi Dave - I am posting your question, and my reply to the list...
Yes, I have one of the amps. I think it's great!
For several years I considered the 87A, but was always wary hearing
report after report of it tripping out with the smallest of mismatches.
This past ARRL CW contest, I was at N3RS, and they had an 87A on the
20m station. Just after the amp was a big tuner. I asked why, and was
told "to keep the Alpha happy." That wasn't what I wanted to hear.

The Acom will tolerate much larger mismatches (3:1 at full power, and
higher at reduced power). The amp looks very much like an ALpha on the
inside. Very high quality components, no skimping in the power supply ,
like some other amps. It measures just about any parameter
imagineable, even the airflow temperature from each tube compartment.
The auto-tune is great, and I understand Alpha now offers it as an 87A
upgrade too. I don't know what the 87A's are selling for now, but
believe it's considerably more than the Acom.

Would I do it again? Definitely!

From: Turkisher Dan-CSLC82
Topic: 4 Message: 5

To join the fray, I too have recently acquired an Acom and it is a joy to use! I don't have experience with the Alpha 87A, but did previously use an Alpha 78 (no comparison). The Acom has alll kinds of built in intelligence, and operating it is truly a no-brainer. While I will usually use a tuner as a matter of course, the ACOM will attempt to match as best it can, including recducing power, and if things are intolerable, it'll drop out in milliseconds and report the error condition. Fine amp, I couldn't be more pleased.

Hi Dan - Could have sworn I hit the send button, but my reply to you never made the list... Anyway, here goes again:

You mention the Acom will reduce power automatically in event of mismatch. How do you set it to do this?

7. [acom-list] Acom RTTY diagnostics

Yahoo group: acom-list (1999 — 2009)
Date: 1999-07-09 14:10:11 UTC
From: Barry Kutner
Topic: 7 Message: 7

Hi all - Being a RTTY op, I tried copying the RTTY diagnostics
produced by the RCU, but I am unable to get print. According to the
manual, it is supposed to be plain old 45 baud Baudot with standard
shift. I did note the tones are inverted from standrad RTTY, but still
doesn't print. Has anyone else tried to copy this stuff?

Hi Barry,
Sorry, I would have responded to your first request for information,
but had none to give you. Nice to hear your problems with RTTY,
but just no help here. This response is to just let you know that there
are listeners out here.

10. [acom-list] Acom Reports

Yahoo group: acom-list (1999 — 2009)
Date: 1999-07-13 19:01:19 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 10 Message: 10

Hi gang,

Thanks to W2UP (or whoever it was if not Barry) for setting up this group.

I have been eyeing the Alpha 87A for a long time. I was all ready to go out and buy one, but I figured I'd wait until Dayton to see if they announced anything new for this now-12-year-old design. The Acom 2000A amp made me re-think my decision about the 87A. This unit looked great! Suddenly, I wasn't so sure about the 87A.

While I REALLY like what I see on the surface with the Acom amp, I'm still a bit apprehensive about being one of the "first on the block" to own one. Barry has given me some good reassurances about it, so I feel a lot better, but I was wondering what the others on this list thought.

Obviously, by virtue of your subscription to this reflector, you are already interested in this amp. Has anyone actually ordered/received/used one? What are your impressions of the amp and of the company? I'm very close to placing an order. I just need some reports from others first.

Glenn:

I took the plunge this week. My 2000a is shipping today.

I ordered the amp mainly because its auto tune. I have a kachina 505dsp which I use via remote control (phone line). The Acom and Alpha 87a were my two choices for a high power remote controlled amp. From what I've heard from a couple of hams and a recent write up from ON4UN, I feel pretty comfortable.

When I receive it and have used it for a few weeks I'll make a post with my thoughts.

You can take a look at my remote station at the url listed below my signature.

From: Turkisher Dan-CSLC82
Topic: 10 Message: 12

Glenn:

I was in the same boat...saw the Alpha as the best available (altho I couldn't afford it), then learned of the ACOM, and to make a long story short, I bought one. It was beyond my budget, but substantially less than the Alpha, and with better features.

While I can't give you a feature-for-feature comparison without having the literature in front of me, the Acom is more feature rich, the remote control is really handy, the autotune is fast and accurate. It has fully lived up to its advertising claims. Its innards are very clean and well built....almost identical to the Alpha in fact. Operating it couldn't be easier. Hit the PTT or key, and you're up and operating.

I too was concerned about being one of the first kids on the block, but now that there is a U.S. service presence, that potential should be minimal. I have not required service of any kind. For what it's worth, ACOM has sold a these radios in Europe and Japan, so there is some level of existing customer base.

I believe that once these become readily available in the U.S., Acom will become the new benchmark for state of the art amplifiers.

Good luck, let us know what you do!

Hi Larry, de Joe AA4NN
On the Acom web site (hfpower.com) you can look at a PDF user manual
where they explain in detail all the protection circuits. You'll be
amazed.
If you click on the Acom 2000A amp detail, under there is the user
manual.

>2) Any shipping delays or backorders? Is it shipped from Bulgaria or
>stateside?
Stateside distributor appears to be in Sudbury, MA.

From: w2up@mindspring.com
Topic: 15 Message: 15

With some of the recent questions about the Acom 2000A, I thought it would be interesting to find out who on the list owns the amp, or is considering one. Please choose one of the following choices:
(This is my first use of the 'polls' feature of this list server, so hopefully I did it right, hi)
73 Barry W2UP

Please select one of the following:

o Yes, I own one
o I ordered one, but haven't received it yet
o Subscribed cuz I'm thinking about ordering one
o Have no interest in the amp, just like getting e-mail
o Other

by going to the following Web form:

http://www.egroups.com/vote?id=931909283281

Thank you!

Having experienced being first on the block with an ICOM706 original, now
pretty much worthless, I can tell you that this amp has been around in
Europe for well over a year. Take a look at ON4UN's endorsement. John does
not lend his name to something that he has not tried out thoroughly.

From: Henry Ingwersen
Topic: 10 Message: 19

Richard: I too have a Kachina 505DSP, and it is my understanding that ACOM and Kachina are working together on software integration. As has been the case with Kachina, I expect software enhancements will become available for the 2000A over time. I can't wait to hook up the 505 to the 2000A!

Topic: 13 Message: 20

A lot of technical details are available on the web. From my demo experience of the 2000A last night, I learned that every conceivable parameter is monitored and protection exist at every level. That holds for both tubes individually (currents, voltages, temperatures, air flow, etc.)
The 2000A is stocked in Sudbury, MA. I doubt that there would be shipping delays at this time, although heavy future demand may well cause back up at the factory.

Topic: 22 Message: 22

Received my Acom 2000A yesterday. I can only second the many plaudits that the Acom 2000A has received here and elsewhere. It really has to been seen to be appreciated. It is surprising that althogh quite complex in features the operation is as easy as it gets. 1 hour or less of playing around will make you feel quite comfortable with it.

One caution, it comes set up for 240 VAC with various other possibilities. For some reason 240 VAC is the correct setting in the states and not 220 VAC. I had to reinstall the transformer after buttoning it up when I received an error message (YUK)!

Jim:

Glad you joined. I just ordered the 2000a which shipped yesterday.

Tell us a bit about the DOS control software. I'm using a Kachina 505dsp via remote control and would like to know if the software will allow me to monitor the amp since the RCU unit will be not be in front of me.

Whats the cost of the DOS software?

Thanks in advance.

Isn't it nice you get an error message like that? Personally my line
voltage is always on the high side (usually 125/250 or so),
so I left it at 240. In addition, there is a menu setting for line
voltage which I set to HIGH. I'm not exactly sure what that
accomplishes. Jim or Jaakko, any info on the voltage setting on the
menu?

From: Jim Idelson
Topic: 30 Message: 30

ACOM Enthusiasts,

I reviewed the questions and comments that have been posted so far. It's good to hear that everyone is having fun with their new amplifiers.

A couple of questions have been raised that I can answer now - other questions are being referred to the engineering group for good, solid technical answers.

1. Is ACOM planning a 3-tube version of the ACOM 2000A?
We are definitely planning a number of new products. However, it is premature to be talking about any of the specifics. Our job right now is to ensure that the ACOM 2000A and its accessories are sold and serviced properly throughout the world.

2. How many ACOM 2000A amplifiers have been sold so far in the US?
I would love to be able to share this information with you, but since unit volumes equate directly to company revenue figures, I can't release these numbers. I can tell you that we began shipping units with FCC Certification to US customers only two weeks ago, and that units are still available with the incentive discount that we are offering for the first 50 units shipped. You should be able to get a good idea of unit volume from this publicly available information.

33. [acom-list] auto-tune?

Yahoo group: acom-list (1999 — 2009)
Date: 1999-07-15 22:49:08 UTC
From: Barry Kutner
Topic: 33 Message: 33

I read ON4UN's review of the Acom 2000A on the hfpower.com
Web site. In it, John says,"... the ACOM is a true autotune
amplifier, while the Alpha 87A is in reality a memory-tune
amplifier... By pressing a simple button on the remote control panel
it fully automatically tunes itself completely within about 0.5
seconds. The auto-tune function is not limited to recalling preset
values, it actually tunes for a conjugate match for whatever load
within the must be..."

As I understand it, each of the band segment presets is
memorized following auto-tune, which is activated via the menu.
But, once in operating mode, the Acom also uses presets after
auto-detecting the frequency.

Is there a mode of operation where the amp auto-tunes each time
you go to a new frequency? Am I missing something?

From: Howard Klein
Topic: 33 Message: 34

Barry,

As I understand it you can use either 1- a default setting; 2- a user setting that you have stored in memory; 3- you can auto-tune again to set optimal conditions at that precise time. If nothing much has changed it should be equal to or very similiar to the 2nd choice in which case it would be redundant.

You got it right, Barry. But the 87A doesn't have the auto-tune function. To set the presets, you have to tune manually and store them in memory.

Barry:

I think it would be akward to see the amp tune itself everytime you change the frequence a bit. Assume you're in a contest, and you move a few hundred Hz or even kHz, you want to call a station, start shouting, and the amp first tunes itself (0.5 or 1 sec), and you are too late for calling, hi.. The ACOM automatically tunes itself each time you instruct it to do so. Across all bands there are some 49 band sections, and for each of them you can memorize up to 10 "impedance settings", which are perfect tune schemes for (slightly) different load impedances. When you change to a different band section, the amp will automatically select the new correct settings for that section and for the particular antenna you are using. If you use the ACOM antenna selector (10 positions) you can link all of that together so that so always have the right antenna and the right settings of the linear for that particular antenna and band section.

Hope that makes it clear.

73

John, ON4UN

Thank you John. It is clear now, and has been performing as
expected. It was the description of the auto-tune feature that made
me think I was missing something. 73 Barry

38. [acom-list] Q & A on ACOM 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 1999-07-17 14:24:22 UTC
From: Jim Idelson
Topic: 38 Message: 38

Here are answers to some of the questions that have been raised on the reflector over the past few days. These answers were provided by our engineering team in Bulgaria:

About RTTY produced by the RCU

Yes, it is the old 45,45 baud Baudot with standard shift and AF frequencies. The reason you thought you don't print is that the information is the binary code as read from the EEPROM memory in the RCU. This is not readable text but only hexadecimal codes that are transcoded from ASCII in BAUDOT. Only the letters in Baudot code are used. In order to get the proper information you should use the transcoding table. After this you also need to have the memory variable allocation and their sense in the EEPROM to interpret. Of course, all this complicated stuff is for service use only. The best way for the user to read the INFO BOX information is to use the RS232 serial port with a PC and ACOM's DOS application. The INFO function of this program generates a directly readable file in simple text format with ".box" extension.

About integration with Kachina

We have begun to take some of the very early steps to collaborate with Kachina regarding software integration. We will provide updates on this effort as we make some progress.

About measurements and protections

The following measurands are calculated on the base of directly measured parameters:

* DC INPUT is calculated from HV and IP, no protections from DC INPUT
* GAIN is calculated from FWD-P and DRIVE, LOW GAIN protection derived
* VSWR is calculated from RFL-P and FWD-P, no protections from VSWR

The items mentioned above - HV, IP, DRIVE, FWD-P, RFL-P - plus the 12 additional measurands listed in S.4-3, p.19 of the Operating Manual, and also 4 supply voltages are directly measured via an analog-to digital converter on the CPU PCB. Multiple protections and tuning criteria are based on this information.

About the DOS control software

Our DOS control software can help you in the AUTO TUNING preparation process for your entire antenna field and also to archive the field description and tuning information. It is not intended to support all functions of the RCU.

About the menu voltage settings

Set the menu selection to HIGH when the mains voltage is typically 5% higher than nominal tap (i.e. higher than 252V with 240V nominal). Set the menu selection to LOW when mains voltage is typically 5% lower than nominal tap (i.e. lower than 228V with 240V nominal). For lower voltages set lower nominal taps (i.e.220V or 200V) and observe same rules for the menu voltage selection. Generally, a voltage of (230-235)V should be considered to be NORMAL with the 240V nominal tap.

The menu selection does not change the real supply voltages. It changes the plate load resistance to which the AUTO TUNE matches antennas. With the HIGH selection you will be specifying a higher plate resistance and vice versa. See also S.5-6a on p.22 of the Operating Manual.

Jim,

Thank you for lots of very useful info. You cleared several issues for me.

Another situation: When I apply maximum drive (80 watts + or-) and the amp is in autotune there seems to be indication of flatting topping when viewed on a scope. If I manually tune, in this case increase loading, the situation as viewed on the scope appears corrected. Any comments?

Hi!
In my amp, which I have been using since early December 1998,
the power cord is just a bit longer than 2 meters (approx 7 feet).
It is a thick one. Did not come with a plug as there are so many
different internationally. Those units sold in the US may come with
a US plug. I do not know.
The unit works fine and have been using it more than half a year.

45. [acom-list] Remote Power On/Off

Yahoo group: acom-list (1999 — 2009)
Date: 1999-07-19 12:05:52 UTC
From: Richard Thorne
Topic: 45 Message: 45

Does the dos software allow one to power the amplifier on and off? This
would be a nice feature for remote operation.

If note, is it a problem to place the appropriate relay in line with the
220v mains? and leave the front panel switch on all the time?

Thanks in advance.

My ACOM 2000 will be waiting for me when I return from Colorado in three weeks. Ordered it at Dayton and UPS was one day late or I would have received it before I left. Also have an Alpha 87A for comparison.

After years of QRP/LP with sporadic QRO, went QRO most of the time last year and look forward to using the ACOM 2000.

47. [acom-list] Remote control

Yahoo group: acom-list (1999 — 2009)
Date: 1999-07-20 15:29:17 UTC
From: Barry Kutner
Topic: 47 Message: 47

Richard - I am not aware of any reason why the main power switch on the amp can't be left on all the time. To the best of my knowledge, it doesn't apply any high voltages to the amp, just turns power on to allow RCU control. I am sure the RCU On/Off switch is a low voltage logic level. The question of the day is whether you can remotely control this via the RS232 port. If so, then you won't need any 220V relays. I'll defer to Jim for specifics... GL/Barry

Richard Thorne wrote on the Amps reflector:

I just purchased an Acom 2000A for my remote controlled station which uses a Kachina 505dsp.

I'm going to use one of the 12v control signals available to turn the amplifier on and off. In order to do this I need a DPDT relay with a low current 12v coil with contacts that can handle 220v' at 20amps. I'll put the relay in the 220v line to the amplifier.

Anyone know where I can get one of these?

Does anyone see a problem with turning the amp on this way?

I'm hoping the Acom amp can be turned on/off with software but I have not found the answer yet. In the mean time I plan on going the relay route. Should get the amp today per the ups web page. Really looking forward to having 1500 watts vs the current 500 watts with my Kachina KC-500-DC amp provides. By the way the KC-500-DC solid state amp is for sale. Its a nice amp that tracks along with the 505dsp.

Barry:

I think you answered the question. If the RCU unit can do it, I'm sure software can handle it. I'll call Krassy today and get more info on their current dos application. I wish they went windows, but for turning the amp on and off thats fine with me.

From: jimi@designet.com
Topic: 45 Message: 49

The function of the red On/Off button on the Remote Control Unit is available as a remote control command through the RS232 port. It will be necessary to leave the main power switch on the amplifier front panel in the On position. No need to buy any relays.

As I've mentioned before, we are working on specification and development of the remote control software. More on this as info becomes available.

50. [acom-list] 2000A Installed

Yahoo group: acom-list (1999 — 2009)
Date: 1999-07-21 18:27:50 UTC
From: Richard Thorne
Topic: 50 Message: 50

Received my 2000a yesterday and just installed it today. All I can say is wow! Plugged it in, let it warm up and wham, 1500 watts out.

Using a Kachina 505DSP to drive it. I made a few qso's on 15 and had a pileup into Europe going. Now I wish I had room for bigger antennas. I have a 60' 25g tower up with stacked F12 tribanders and was having a tough time hearing some of the stations. Unfortunately, I really don't have room for another tower, or bigger antennas on the current tower.

Hi everyone,

My Acom 2000A amplifier arrived yesterday! It's a birthday gift
from my XYL. Eat your hearts out!!

Let me illustrate an example of what one can accomplish
when properly motivated:

3:30 PM - Leave work early because the UPS web site indicated
my amp was on it way.
3:40 PM - Stop at Builder's Square to get supplies to run 240V
circuit for the amp.
4:30 PM - Frustrated, I leave with only a fraction of what I need!
(Builder's Square was on the way home, but they
stink compared to Home Depot!)
5:00 PM - Arrive home to find the Acom boxes waiting! Yipee!!
5:01 PM - Run out to local building supply joint for the rest of the
wiring stuff.
5:30 PM - Return home and wolf down dinner (a bowl of cereal,
XYL was working and I wasn't goint to waste
ANY time! :-)
5:40 PM - KA3UKL stops by to pick up the generator we used for
Field Day.
6:00 PM - Resume wiring job.
6:15 PM - Realized I needed a few more things - back to the local
building supply joint (sigh!).
6:45 PM - Return home and resume AGAIN!
7:10 PM - Finish wiring job (never did electrical work like this, so
I was pleased with the speed of the job!)
7:11 PM - Unpacked the 2000A and placed it on the operating table
in the spot I cleared for it previously (clearing it was
a big job in MY shack, but it was like preparing a
nursery for a new baby!)
7:30 PM - FINALLY got the final screw out of the cover! This baby
has a million screws in the cover, so get it right the
first time, gang! Don't get me wrong, I'm glad it has
so many. It's built like a tank!
7:31 PM - Remove the RCU and admire the internal construction!
VERY NICE!
7:40 PM - Transformer is installed.
7:45 PM - Plug is installed on power cord. YOU must wire the power
plug on this, so have the appropriate one ready when
the boxes arrive.
7:46 PM - Plug in remote control head and cables to exciter.
7:47 PM - Begin putting the cover back on.
7:55 PM - Finish putting the cover back on (remember, lots of screws!).

7:56 PM - POWER UP! (No smoke or sparks, so I did something right!)
7:58 PM - *** FIRST QSO FROM K3PP WITH 1500 WATTS!!!!! ***
3Z0something (Poland) on 20m fone

The rest of the night was spent fiddling with the menus (changed the startup display from "ACOM2000A" to "CQ K3PP" :-) and getting some excellent signal reports. I never had to call anyone twice!

I can't wait for the next contest!! Look out baby!

Congrats Glenn:

I've been enjoying mine since yesterday. I just need to improve my receive side now, I felt like an alligator on 20 meters last night.

Yes. 40 minutes is exactly the typical time required to set up a
new ACOM 2000A for the first time.

Congratulations, Glenn! Have fun - lots!

Jim K1IR
ACOM International

> Hi everyone,

My Acom 2000A amplifier arrived yesterday! It's a birthday gift
from my XYL. Eat your hearts out!!

Let me illustrate an example of what one can accomplish
when properly motivated:

3:30 PM - Leave work early because the UPS web site indicated
my amp was on it way.
3:40 PM - Stop at Builder's Square to get supplies to run 240V
circuit for the amp.
4:30 PM - Frustrated, I leave with only a fraction of what I need!
(Builder's Square was on the way home, but they
stink compared to Home Depot!)
5:00 PM - Arrive home to find the Acom boxes waiting! Yipee!!
5:01 PM - Run out to local building supply joint for the rest of the
wiring stuff.
5:30 PM - Return home and wolf down dinner (a bowl of cereal,
XYL was working and I wasn't goint to waste
ANY time! :-)
5:40 PM - KA3UKL stops by to pick up the generator we used for
Field Day.
6:00 PM - Resume wiring job.
6:15 PM - Realized I needed a few more things - back to the local
building supply joint (sigh!).
6:45 PM - Return home and resume AGAIN!
7:10 PM - Finish wiring job (never did electrical work like this, so
I was pleased with the speed of the job!)
7:11 PM - Unpacked the 2000A and placed it on the operating table
in the spot I cleared for it previously (clearing it was
a big job in MY shack, but it was like preparing a
nursery for a new baby!)
7:30 PM - FINALLY got the final screw out of the cover! This baby
has a million screws in the cover, so get it right the
first time, gang! Don't get me wrong, I'm glad it has
so many. It's built like a tank!
7:31 PM - Remove the RCU and admire the internal construction!

VERY NICE!
7:40 PM - Transformer is installed.
7:45 PM - Plug is installed on power cord. YOU must wire the power
plug on this, so have the appropriate one ready when
the boxes arrive.
7:46 PM - Plug in remote control head and cables to exciter.
7:47 PM - Begin putting the cover back on.
7:55 PM - Finish putting the cover back on (remember, lots of screws!).
7:56 PM - POWER UP! (No smoke or sparks, so I did something right!)
7:58 PM - *** FIRST QSO FROM K3PP WITH 1500 WATTS!!!!! ***

From: Larry Crim
Topic: 58 Message: 58

Whats the procedure for activating 10M on the 2000A? Does it involve doing anything inside the amp or is it done via the RCU. If its inside the amp I want to do it while installing the XMFR. This thing has a LOT of screws!

73,
Larry K4AB

Hi Friends:

I'm using a ACOM 2000 since December last year. Is a fantastic
peace of equipment.
I do not know way, but on 10 meters last contest I notice that some
times the linear droops out like a higher swr.
Anybody noticed that before?
I do have the intention to install the optional blower. I did not
find instructions for it.

Best 73 and Dx

Oms PY5EG

61. [acom-list] excess drive in stby?

Had something odd occur tonite with the Acom 2000A. Was in
QSO barefoot, with the amp turned on to warm up. After the amp
was warmed up, and in STBY mode, it started beeping with the
drive LED lighting. With carrier on xciter only (200W), display said
"reduce power."
Has anyone one else had this happen? Why should the amp care
about the drive level when it standby?
Tnx/Barry

Hi Barry,
I'm on the reflrctor now !
Since I don't have one of the amps....yet, only thing I can think is
that
the circuitry that tells you you are overdrivig the amp when amp is in
circuit
is not deactivating when in Standby mode and giving you the error
message
still. Sounds like the inhibit function not working when in standby
mode
for this detector circuit. My guess.

Dear Barry,

This is just to tell you that this amplifier is too smart - Hi.
It wanted to notify you that just in case you decide to
start using it you must reduce the driver output power
first. It's that simple.
This amplifier is just different from others currently in use.
We have done extensive testing of ACOM 2000 A in
rude contest conditions during last year at LZ9A and
I must say it is the best available on the market today.
You will not be dissapointed by the preformance of
yours. Be sure.

Hi Valeri - Yes, too smart for its own good, like the HAL computer from the book/movie, "2001, A Space Odessy," hi. If the amp is in standby, it shouldn't care how much power the exciter runs. Reminds me of the now-famous line "it's not a bug, it's a feature!" Other than this minor flaw, the amp has worked very well for me, in the short time I've owned it. Look forward to upcoming contest season (will miss WAE CW this year, but will put it to the test in CQWW RTTY in Sept). 73 Barry

Hi Barry,

Well, I have just read what you have written for the
FRC Newsletter about ACOM 2000 A.Glad you are happy
having your own ACOM there.

Amplifier needs to know what is the driving power
not only because it's so smart.
It needs this info to work as fast as mentioned in specs
when after warming it up you decide to start operating
full power. That is also kind of protection.(fool proof
design - hi).

Good luck in a comming contests. See ya there either from
LZ9A or LZ2CJ.

Wally
wally@...

feature!" Other than this minor flaw, the amp has worked very well for
me, in the short time I've owned it. Look forward to upcoming contest
season (will miss WAE CW this year, but will put it to the test in CQWW
RTTY in Sept). 73 Barry

This all makes sense, but the beeping is still annoying.
With the headphones on, it's less of a problem, but is
there any way to al least silence the beeping for this
particular situation?

I consider this to be a minor annoyance, but I otherwise
love this amplifier! I have it about two weeks and I have
blasted through even the worst pileups. Having never
owned an amplifier, it now seems almost TOO easy!

I had to call FW8ZZ the other day THREE times to get
through and that was only because I couldn't find his
RX frequency! Once I found it, BAM! I got him! This
is SO cool!

Glenn,

I do not know, if you could mute the beeping there.
I will ask LZ1JK next days and will let you know.
Anyway, noise warning is important I think ,especially
when someone who quite often is absent-minded
as myself is torturing the amplifier - Hi !?!?

Glenn:

I think there are volume controls on top of the RCU unit. You need a small
insulated screw driver to adjustt them.

Dear Rich,

You are right. I have spoken to LZ1JK today and the
advise was exactly that - use volume control on RCU
to reduce the beeping as much as needed. That is the only way.
One still will have light signalisation to notify
him to reduce the driving power.

Thanks guys,

I think this is exactly what I will do. It is good that the amp
will warn me of my own pending stupidity, so the beeping is
valuable. Turning it down to a less annoying level is a good
suggestion.

73. [acom-list] Overdriving

Yahoo group: acom-list (1999 — 2009)
Date: 1999-08-05 11:17:51 UTC
From: samsel@wtcsofia.bg
Topic: 73 Message: 73

Hi guys,
Is the jokes permitted !
If yes, even me with mine 150 kg i can hardly obtain the 203 Watts overdrive! Actually this is the software limit to the input of ACOM 2000A ! This is just to prevent mistake of using a very high drive power in case of switching to "operate(green LCD)".

Also some of You -proud owners - can notice that when step on border between two band segments i.e. 3799.99 in SSB mode the "switch" between upper and down segment may appear. The owners may hear the moving of the variable caps fort an back , but this is not a big deal, just live it . It is just a comparison of the detuning between two neighbouring segments.

Good luck to all of You , been in luck to have IT , as well the upcomming !

Low band operation is a great fun!

73! Nick LZ1JY

PS: Glenn , i'm jealous ! This is my third one and she still stay away from the radio! No gifts forecasted in this millenium!

BTW: Doc, did you solve the neighbouring problems

74. [acom-list] Optional fan installation

Yahoo group: acom-list (1999 — 2009)
Date: 1999-08-07 22:12:00 UTC
From: AA1ND@aol.com
Topic: 74 Message: 74

Dear friends,
They are questions regarding optional fan installation:
Here is Section 3. of the Technical Supplement concerning the optional fan installation. We have suitable 24VDC/2.4W PAPST fans stocked. The 119x119mm type is standard for PAPST and MATSUSHITA and several other manufacturers. The 24V DC is standard, but 12V DC, 100V AC, or 120V AC could be adapted too.

1-2. SAFETY FIRST

The amplifier works with high voltages: +2850VDC, +430VDC, +340VDC and 240VAC which are DANGEROUS TO LIFE! All necessary steps are taken these voltages drop to harmless levels within 30 minutes after turning it off, but for your safety you must check this EACH TIME whenever you remove the cover of the amplifier.

First pull the amplifier power plug out of the mains wall outlet and wait at least 30 minutes. Then make sure that no dangerous voltages are present. For the purpose take applroximately 1 meter (3 feets) WELL INSULATED lead with Working Voltage as a minimum of 3000V, for instance the type 982041 or 981865 High Voltage Test Lead Wire manufactured by DEARBORN or equivalent. Bare it at both ends. Connect one of its ends FIRST to the GROUND STUD (on the rear panel), and AFTERWARDS, holding it BY THE INSULATION ONLY at a distance of minimum 10cm (4inch), touch with its other end consecutively the following critical points of the amplifier:
- the copper strip of the plate parasitic supressors;
- on HV printed circuit board - both points indicated with "+2850V";
- on the same board - both points indicated with "+430V" and "+340V".
......
......

3. INSTALLATION OF OPTIONAL FAN

The fan is supplied as an option with a set of 8 screws, nuts and washers and is sized 119x119mm. It can be mounted by the dealer or manufacturer on request.

W A R N I N G HIGH VOLTAGE! Before attempting any action, thoroughly read
==========
throuogh and satisfy Safety Considerations in Section 1-2!

C A U T I O N Pay attention to the air flow direction indicated on the fan
==========
that it is from the outside.

In order to mount a fan, the amplifier must be opened. Remove the power transformer. Observe the considerations from S.2-2 of the OPERATING MANUAL but in reverse order. Then unscrew the four bolts and remove the air intake protecting grid from the rear panel.

Using four M4x12 or similar bolts, mount the fan on its place directing its leads in the shortest way to the inside. In case that the shortest way is inconvenient, use the provided for this purpose aperture close to the fan, piercing the blanking cable gromet. Mount on the fan rear the protecting grid using the remaining four M4x12 bolts.

C A U T I O N Compare the type (DC or AC) and nominal voltage of the
==========
supplied fan with the indicated in Table 2-1, ACOM2000A Individual Data in the Operating Manual.

When the fan is for 12V DC or 24V DC, connect it to the small board, located immediately below its aperture. Fan's positive lead, which is usually red, connect to board pad indicated "+", and the negative lead - to the other indicated "-". If the nominal voltage of the supplied fan is different from that indicated in the table, you must open the cover below TUBE DECK and there, on the AIR SENSOR board, move the jumper for the appropriate voltage: 12V or 24V.

When the fan is for 100V AC or 120V AC, connect it to the MAINS CONTROL board, located just behind the power transformer. One of the AC Fan leads must be connected to EXT.FAN-0 terminal, and the other to the EXT.FAN-100, respectively -120V, depending on fan's nominal voltage. In addition you must put a mains fuse into the board fuseholder, indicated EXT.FAN (Fig.2-1). The nominal current and type of the fuse must correspond to the AC Fan current consumption.

Now reinstall the power transformer and cover of the amplifier. Observe the considerations from S.2-2 of the OPERATING MANUAL

Please describe in details the effect you noticed on 10m. If possible, try the same into a dummy load. Does it appear randomly from time to time or after several minutes of continuous transmission? Does it appear on any other band?

In MEASURE sub-menu check and log all 20 parameters after making an USR tuning, possibly at 1500W output and in faulty conditions.

Best 73! Vassil Vassilev, LZ1JK
President of ACOM Ltd, Sofia, Bulgaria
Krassy K1LZ -ACOM International Inc- USA

hello,

there are some problems with my ACOM 2000A.

During WAE CW test my ACOM dead.
After few CQ's with 1000W on FORWARD POWER amplifier shuts down.
when I switch on RCU displayed message:ANTENNA RELAY OPEN IT SHOULD BE CLOSED

I checked all that I can and nothing. Switch amp for 1 hour and try again.
Was the same situation!

Don't know what to do?

Any comments?

Hi Howard ,
This is the E mail I sent to somebody els HI! Please send me the answers on this Q.

Dear Howard,

The technical supplement comprises and we can send to you a copy of: all electrical schematic diagrams, layouts for all PCB assemblies in the amplifier, description of DOS program and cabling for antenna tuning via PC, and also rules and a list of commands for local network control via the serial amplifier port.

Concerning the protection problem "low filament voltage", please do the following in order to supply me with technical information:

a} tell me more about the conditions of this protection. When did it trip: at power-on, after the 2.5 minutes heater count-down, or during working period? Have you noted the HEATER LED indicator on the RCU to be lit for long periods before the protection trips? How long was the time between two trips?

b) is your amplifier connected for 240VAC (as supplied) or you have changed the voltage selector to another nominal value?

c) please enter the MEASURE sub-menu and read out the following values:
- MAINS (line input voltage);
- FIL-V (filament voltage, nominal value is 12.6V)
- IF-REAR (filament current - rear tube, nominal value is 3.6A);
- IF-FRONT (filament current - front tube, nominal value is 3.6A).

For your information, the nominal filament voltage is 12.6V. The HEATER (yellow LED) indicator on the RCU is normally dark. It will constantly light if the filament voltage drops below 11.6V and it will frequently blink if the voltage exceeds 13.6V. In both cases the voltage selection may need to be changed if this condition predominates. The heater voltage protection would trip at voltages below 10V and over 14.4V and the corresponding message to the operator is issued on the RCU. Respectively, the thresholds for heater current protection are 3A and 4.4A, and appropriate messages appear when tripped.

Anyway, occasional protection trips may be a symptom for loosened contacts somewhere in the filament network, so if it persists without any evident external cause, please keep me informed in order to timely solve the trouble.

Krassy

serial amplifier port.

Concerning the protection problem "low filament voltage", please do the
following in order to supply me with technical information:

a} tell me more about the conditions of this protection. When did it trip:
at
power-on, after the 2.5 minutes heater count-down, or during working period?
Have you noted the HEATER LED indicator on the RCU to be lit for long
periods
before the protection trips? How long was the time between two trips?

b) is your amplifier connected for 240VAC (as supplied) or you have changed
the voltage selector to another nominal value?

c) please enter the MEASURE sub-menu and read out the following values:
- MAINS (line input voltage);
- FIL-V (filament voltage, nominal value is 12.6V)
- IF-REAR (filament current - rear tube, nominal value is 3.6A);
- IF-FRONT (filament current - front tube, nominal value is 3.6A).

For your information, the nominal filament voltage is 12.6V. The HEATER
(yellow LED) indicator on the RCU is normally dark. It will constantly light
if the filament voltage drops below 11.6V and it will frequently blink if
the
voltage exceeds 13.6V. In both cases the voltage selection may need to be
changed if this condition predominates. The heater voltage protection would
trip at voltages below 10V and over 14.4V and the corresponding message to
the operator is issued on the RCU. Respectively, the thresholds for heater

current protection are 3A and 4.4A, and appropriate messages appear when tripped.

Anyway, occasional protection trips may be a symptom for loosened contacts somewhere in the filament network, so if it persists without any evident external cause, please keep me informed in order to timely solve the trouble.

Krassy

Krassy,

Nice to hear from you. To answer questions:
1.In both cases trip occured during working conditions.
Approximately 2 weeks between trips. In the first case I could not return to operate from standby since the indication was that the condition continued. The next time I used the amp (next day) the [problem did not occur. About 2 weeks later it occured again. I was able to switch to operate with no problem. It has not reoccured for about 2 weeks.
Mains voltage 245 as read on at this time. To my knowledge it has not varied from this value by more than a few volts at any time.
2. Both tubes fil current 3.7A
3. fil voltage 12.7V-12.5V

Lookin forward to the software. It will help to monitor several parameters at once.

Howard

Hello,

TNX for information!
MY ACOM 2000A is working fine!
Problem was in small condensator I replace and now is everything OK!

Thank you very much OH1MA and LZ1JK for help

Topic: 80 Message: 80

This is a write-up I did for our Contest Club and thought someone might find it interesting here.

Kids are back in school, I'm over the little bout of Flu caught on the Disney Cruise and I finally found time to unbox and install my new ACOM2000A amplifier day before yesterday.

A little background is in order. I have operated QRO off and on during my many years as a ham, most often barefoot or QRP since I work primarily CW and from Russia for several years where maximum power for a Class "A" station was 200W. Ran a TS-930SAT for years, then the FT-1000D which I still use, and a TS-950SDX which is primarily on digital modes now and band monitoring with the SM-230. Also have a FT-1000MP which was one of the first models released.

Since our Radio Shacks in Russia were also the HRO of Russia, we handled all the ham lines in the stores (Ave. store 10,000 sq. ft and more like a Best Buy - I sold out over two years ago). As a result, I have a little of everything laying around here. My favorite is my FT-1000D, followed by the FT-1000MP, the TS-950SDX, Kenwood TS-570D, TS-50, and various VHF gear. Did have one of just about everything at different times during the last seven years. I got to test the gear for the Russian FCC type acceptance, hi. Last year I dug out my old FL-7000 to use for SSB when the TARC gang came out here to work the IOTA contest. Bought an Alpha 87A last year and have used it off and on. At Dayton, was intrigued by the ACOM so signed up for one when they were to be released.

First impressions: The ACOM2000A comes like the Alpha 87A with the transformer shipped in a separate box. It is almost exactly the same size and weight as the Alpha 87A even to the number and placement of the gazillion screws needed for removal to install the transformer. Inside, it even looks like the Alpha... very high quality components and workmanship. ACOM doesn't supply a 220V plug, so unpack, transformer install, plug install, etc takes about 1- 1 1/2 hours. The ACOM comes with a small control head with is fully digital and connects to the main amplifier by a cable about 3M long. Very nice arrangement since the amplifier can then be placed in any convenient place and fully controlled and monitored from the pad which is only the size of a small paperback book and has a folding, metal stand in the rear so it sets up nicely for viewing.

The ACOM2000A auto-tunes and sets up with a band change with only one dit at 45 wpm in about 1 second. The small control head is more like a tiny computer screen with full information about every aspect of the amp on demand; plate voltage, current, filament voltage, etc etc. Power output and SWR are continuously displayed with an LED array as well as status LEDs for

protection, Amp On, grid, etc. Also shows band segment of operation. The ACOM 2000A breaks every amateur band into multiple frequency segments. The user can store up to ten (10) sets of tuning adjustments for every frequency segment - allowing individual settings for multiple antennas on each band. VSWR can increase considerably when an antenna is operated away from its resonant frequency. Other displays are available by programming the display. The amp went together easily, and uses one PTT line and a coax connection. Simple and operated on first connect automatically with 1.5KW out. The amp is almost an Alpha 87A clone as for general features and operation but has the nifty control head and seems faster to auto-tune to band if that's possible. It is VERY quiet compared to the Alpha but I understand they have a new fan assembly for the Alpha that solves some of the noise problem. Both amps operate flawlessly and efficiently. The ACOM has a broader SWR tune range since the Alpha here can't auto-tune my 402CD beyond about 600W output since I have a very poor SWR on 40 due to the 402CD coupling with the steel beams in my house depending on the direction the beam is pointing. The ACOM2000 tunes to full output under the same conditions.

ACOM Pluses: Control head is great. Also has a RS-232 output for computer control with a soon to be released program. Wider SWR tuning range. Quieter. Less expensive final tubes (Svetlana 4CX800A tetrodes operating in a grid-driven configuration) and much better price point! About $5,500. They are also releasing an automatic heavy duty remote antenna switch in October which will "remember" the antenna and settings for each band segment and both auto-tune the amp and select the correct antenna (8 positions) with a single dit. single feedline to the switch, multiple feedlines out. I ordered that as well at Dayton so that will be another report.

Negatives: Not as spectrally pure as the Alpha 87A. Never had any TVI in the house with the Alpha 87A other than the alarm system which was cured with ferrites. Have some TVI on just about every band with the ACOM. Haven't even begun to address that issue yet, but with the kids it restricts my time on the air. Unknown reliability/warranty service but the Europeans have had them for over a year now and many of my friends there who have bought this amp praise it. No negatives yet posted on the ACOM reflector http://www.egroups.com/group/acom-list/. ON4UN did a pretty good review/recommendation.

Now I have two amps, and guess I'll go to two radio operation next. I had the cabinetry custom built for multi-radio operation but I've never had the time to fully complete it.

See ACOM's website at http://www.hfpower.com/.

I'm sold. Seems like a contestor's dream amp/antenna combo.

Hi Jon:

Nice write up. I've had my 2000a for a few months now. I use it with a Kachina 505dsp via remote control. I'm anxiously awaiting the software so I can monitor the amp from my home (the amp is at the office with the rest of the station).

I do have one question for you since you have both amps. How does the relay noise compare? I operated a 87A at N3BB's place last year and during cw it appeared to be very quite. The Acom appears to be a bit noisier?

Thanks in advance.

Both my Alpha 87A and the ACOM are virtually silent as to any relay noise. I can hear nothing. The fan on my Alpha is quite loud. The only noise the ACOM makes is a little low thumping on transmit (I work CW 95% of the time) when the amp is keyed.

Interesting... My relay definitely makes noise. I don't operate QSK
so it's not too bad, but it is louder than I expected. Others?

84. [acom-list] QSK with the FT-1000MP

Yahoo group: acom-list (1999 — 2009)
Date: 1999-08-30 20:43:15 UTC
From: Neil King
Topic: 84 Message: 84

Well, I've had my Acom2000a for exactly 2 days and have to say that I'm very happy so far. Setup was straightforward and performance certainly meets my expectations.

One thing that surfaced immediately, however, were issues with my grounding system. Operating from the second floor of a house appears to make the ground run appear a perfect half wavelength on 10 meters. If I load the amp to any modest amount of output (>200W) on a frequency over 28. 275, my FT-1000MP immediately resets itself quite nicely. Ah well .... improving the grounding system is next weekends project.

My question is with regard to QSK and the FT1000MP. Has anyone experience with connecting the FT1000MP and the Acom2000A for QSK operation? If so, I'd appreciate some advice/direction on connections etc. Both are are relatively new to me so any comments would be appreciated.

Regards,
Neil King

After some further investigation, my relay in the ACOM does click, but it is not very noticeable unless I listen for it. The amp is located about 6' away from the opaerating position and is recessed into a custom made cabinet made for amps. When I put the FT-1000 into full QSK, it becomes noticeable.

Thanks for the response Jon:

I don't think the relay noise is a problem I was just curious. Besides, my Acom is 6 miles from my operating position, so the relay noise is not a problem, HI.

I wasn't sure about the relay click because I almost always operate
with the Heil headset on. I checked last night and yes, mine clicks
but it's not annoying unless I use QSK. I guess I'm not a good enough
CW op, because I very rarely use QSK. Because of this, I don't have a
problem with the relay click. With the headset on, I can't even hear it.

I've been following your discussion below. I've just installed an FT1000MP
and an Acom2000. I'd appreciate a description of any special wiring
required to operate QSK as its a feature I prefer to use when sending CW.
Neither manual has much of a description of what's required.

Any assistance would be appreciated.

Topic: 87 Message: 89

I did no special wiring other than the relay line between my IC-775
and my 2000A. Both are RCA jacks, so a simple audio cable I had
in my stash did the trick. It works fine at my typical speed of 25-30 WPM.
If you're a real speed demon (50+ WPM), I'm not sure how it would work.

Again, I tend NOT to use QSK. My brain isn't smart enough to handle
it very well.

Neil:

I have exactly the same setup, works great! I don't work much CW and have found I can just hook up the RF cables and both the MP and Acom are fast enough to key at the speeds I use. If you're a hi speed CW op then you should add the extra control cables for true QSK.

The ACOM manual p. 8-9 describes how to use the MP to key the linear for QSK.

And the MP manual, p.67-68 describes the MP perspective. The BAND DATA jack pin 2 povides the keying for QSK. Note that your relay may need to be enabled/disabled (via S1001), depending on how you previously had it set up.

Good luck!

91. [acom-list] Re: QSK with the FT-1000MP

Yahoo group: acom-list (1999 — 2009)
Date: 1999-09-01 22:36:45 UTC
From: AA1ND@aol.com
Topic: 84 Message: 91

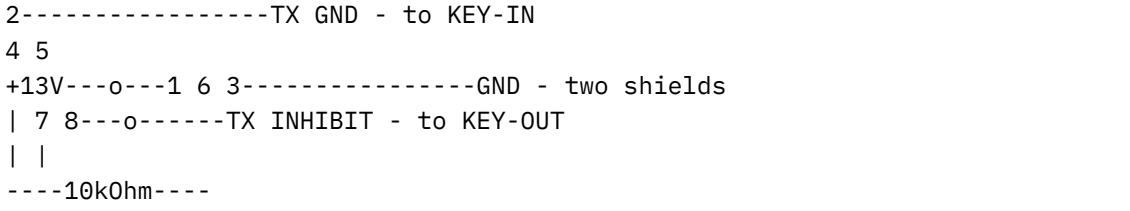
Hi Neil,
I am glad that you are happy with ACOM 2000A so far.....
This is a detailed answer on your Q: QSK with the FT1000MP:

Here is the information you may need to connect properly your FT1000MP to the ACOM2000A for QSK operation in order to get best results.

1. You will need the following materials to prepare a control cable:

- a piece of two-lead shielded (audio) cable, maximum 3m/11ft long,
- a resistor 10kOhm 0,125W,
- an male DIN-8 (8 pins) connector (mating to FT1000MP BAND DATA connector),
- two phono type (RCA, CINCH) connectors (mating to ACOM2000A KEY-IN and KEY-OUT connectors).

2. Look into the FT1000MP OPERATING MANUAL. Find the layout of the BAND DATA connector, located on the top-right corner of page 4. Note that the DIN-8 connector pins are numbered in a special order: not successively but as follows:



(DIN-8, as viewed from the transceiver's rear panel "BAND DATA" and from the sodering side of the male cable connector)

pin1 (+13V) - left from the center,
pin2 (TX GND) - on the top,
pin3 (GND) - right from the center,
pin4 (BAND DATA A, not used) - above pin 1,
pin5 (BAND DATA B, not used) - above pin 3,
pin6 (BAND DATA C, not used) - the central,
pin7 (BAND DATA D, not used) - below pin 1,
pin8 (TX INHIBIT) - below pin 3.

3. First solder the 10 kOhm resistor between pins 1 (+13V) and 8 (TX INHIBIT). This "pull-up" resistor is needed for FT1000MP in order to activate its "TX INHIBIT" input. Now, if you connect this DIN-8 connector to the BAND DATA, the transceiver wow'nt transmit until you pull pin 8 (TX INHIBIT) to the ground. This is what ACOM2000A does to enable transmitting selectively, when its antenna relay is in safe condition (steadily closed or open).

Before trimming the cable end, thread on it the DIN-8 protective cap. Solder cable shields together and then to pin 3 (GND). Solder one of the active leads to pin 8 (together with one of the resistor leads). Mark the other end of this active lead as KEY-OUT. Solder the second active lead to pin 2 (TX GND). Mark its second end as KEY-IN. Keep track on all parts and leads to be well insulated when assembling DIN-8 protective cap in order not to make any short connection between pins.

Split the second cable end and thread the two phono connector accessories. Solder the active KEY-IN and KEY-OUT leads to the central pins and their shields to the outer connector rings. Assembly the connector's protective caps and your control cable is ready.

4. Before connecting or disconnecting cables always switch off both the transceiver and the amplifier.

Look in the FT1000MP OPERATING MANUAL. Find the Rear Panel Controls & Connectors on page 19/20.

Slide the LIN switch (21), located in a slot on the FT1000MP rear panel, to the OFF position. This will disable the internal TX GND relay of the transceiver and your QSK-CW timing will get better. Using this mode is possible as the amplifier's input KEY-IN is sensitive enough and does not require any relay buffering.

Connect the DIN8 connector of the prepared control cable to the BAND DATA (16) connector of FT1000MP.

Now look in the ACOM2000A OPERATING MANUAL. Find Fig.2-2 "Connections" on page 8. Connect the cable KEY-IN and KEY-OUT to the same name connectors (d) and (e) of the amplifier (bottom left corner as seen from rear). See also the respective pagraphs (d) and (e) on page 9.

5. Now you can use the QSK feature of both FT1000MP and ACOM2000A with maximum switching safety and timing quality. You don't need doing anything more and the following information is only intended to give some additional technical information about ACOM2000A KEY-IN and KEY-OUT signals.

a) The KEY-IN socket on the rear panel is the antenna relay transmit/receive control input of the amplifier.

When in OPERATE, on this input appears a DC signal which must be held to ground to activate the amplifier in transmit. This can be done via a relay contact or semiconductor (transistor or integrated circuit) with suitable polarity (positive to ground).

The electrical specifications for the respective transceiver's output are: -
switching voltage (open circuit) minimum 12V;
- switching current (closed circuit) minimum 12mA;
- voltage drop or resistance @ 12mA current (closed circuit) maximum 1.5V/250 Ohm.

FT1000MP output exceeds all of them.

You can control the KEY-IN signal in two different ways.

The preferred mode is to connect the KEY-IN socket with a shielded cable to the transceiver's output which goes to ground on transmit. The FT1000MP corresponding output is named TX GND (pin 2 of BAND DATA connector) and its electrical specifications exceed the needs without any buffering.

You don't need using the followign second way with FT1000MP. It may be useful with any old type transceiver which may have not a suitable output, providing the "ground on transmit" output signal. Connect with a shielded cable the PTT or CW keyer contact to the amplifier rear panel KEY-IN socket. Then connect with a shielded cable the amplifier rear panel KEY-OUT socket to the PTT or CW-KEY transceiver input. In this mode the amplifier will just pass directly the PTT or keyer signal to the transceiver when not powered and in STBY. In OPERATE mode it will follow it always when the antenna relay and/or band switch are in safe position and will disable transmitting during their motion or any risk situation.

Have in mind that the second way of transmit/receive control could be very useful also if a transceiver has improper sequency of its T/R signals. For instance, in some old type transceivers, the "ground on transmit" signal is late at beginning (RF power appears before it); or it competes at the end of transmission (disappears before RF power).

b) The KEY-OUT socket on the rear panel is an extra output signal from the amplifier to the transceiver. It could be used to improve the T/R switching process and increases the exploitation reliability of the amplifier and of the transceiver too. This output can be used in two cases:

- when your transceiver has the respective input to disable transmitting and the preferred connection of the KEY-IN socket is made - see (a). For FT1000MP this is the TX INHIBIT input (pin 8 of BAND DATA connector). We recommend that you connect it with a shielded cable to the KEY-OUT of the amplifier.

- when the second may of transmit/receive control is used with any old-type of transceiver - see (a).

The output KEY-OUT of the amplifier is open drain circuit and it can hold to ground a positive DC signal. At the moments when the amplifier is ready to transmit this line is held to ground, When transmitting is not permissible the output is open (for instance when the antenna relay is in process of switching or the band switch is rotated).

The electrical specifications of the amplifier's output are: switching voltage capability (open circuit) up to +50V; switching current capability (closed circuit) up to 20mA; resistance @ 20mA current (closed circuit) maximum 120 Ohm.

When the amplifier is not powered and also in STANDBY mode this output is directly connected to the KEY-IN socket. Then the amplifier will return the "TX GND" signal back to the "TX INHIBIT" in order to enable transmitting.

In OPERATE mode the KEY-OUT signal will follow the incoming on the KEY-IN socket "TX GND" always when the antenna relay and/or band switch are in safe

position and will reject transmitting if any risk condition is detected.

Topic: 92 Message: 92

Vassil / Krassy,

Thanks to you both for a detailed and straightforward explanation of the advanced QSK hookup for the FT1000MP.

I'll let you know my results late next week after I've had a chance to put the cables together and give it a try.

In the few hours I have available outside of work, I'm having so much fun operating QRO that its hard to break away and make upgrades to the system!!!!

Next major project of course will be the installation and integration of the Acom2000SW remote antenna switch when it becomes available. I don't know whether I described the installation here, but it consists of a Cubex Mantis 40- II 5B4 with addt'l 30 meter elements. Essentially the setup runs 4 elements on 6 through 20 meters and 2 elements on 30 and 40 meters. Since I'm feeding each loop separately, the remote coax switch will be the icing on the cake. Currently I'm using a DX Engineering switch (5 to 1) which handles (non-automatically) 10 to 20. The 6, 30 and 40 meter runs are to the shack and are switched separately.

Once the Acom2000SW is available, I'll reconfigure the system to have 10 thru 40 off the switch as well as my 80 and 160 slopers. Operating should be a breeze with auto tune and auto antenna selection driven by the FT1000MP. At least that's the first part of the project. The second is setting up remote software so that I can control everything including my rotor system via PC and the Internet remote. I'd like to be able to operate the home atation from wherever I am as long as I have Internet access and my laptop!! Both the amp and coax switch appear tailormade for the type of installation I'm working towards here.

Ah well, back to work.

Thanks again for all the information.

Regards,

Neil

93. [acom-list] Auto antenna selection?

Yahoo group: acom-list (1999 — 2009)
Date: 1999-09-04 00:02:09 UTC
From: Barry Kutner
Topic: 93 Message: 93

HI Jim and Krassy:
Question for you guys...

On the high bands, I have more than one choice of antenna.
Naturally, the tuning is a bit different for each antenna. I know I can
set a default preset, then manually select another tune setting on
the RCU. Is there any way, via the Acom's RS232 port, to
automatically switch the preset selection from A1 to A2, for
example? My station is wired for automatic band/antenna switching
with Top Ten devices band decoder (Yaesu) and six-way switch. I
can switch between run (EU) and mult (south) antennas by flipping
a switch tied into the Top Ten boxes.

Thanks/Barry

Hi ,
This E mail is to inform every body who have ACOM 2000A amplifier ,that the first shipment of ACOM2000S- Automatic antenna selector and ACOM2000SW -Remote Antenna Switch in US is made. This units are available for immediately shipment from ACOM International. For order phone : 978 440 7555 Fax :978 440 9008 or in the net at : www.hfpower.com
The automatic antenna selector ACOM2000S and the remote antenna switch ACOM2000SW are offered and could be separably and/or together purchased. Either, could be standalone used in other than ACOM's automatized systems thanks to the simple 4-bit parallel BCD control code used between the two units. They only change 1 out of 10 antennas under computer and/or manual control and care about anti-hot switching self-protection.

Hi Neil,
Do you receive your ACOM2000S and ACOM 2000SW .
I wont to tell you that the Automatic ANT. Selector is set up for a Mains
AC 240 V
You can use this that way or you have to open the selector and rearrange the
jumpers for 120 V. AC.
If you have any Q. regarding the set up please call me at 978 440 7555

From: Ted Demopoulos
Topic: 98 Message: 98

Hi,

Anyone (successfully) using the ACOM amp with a ICOM 706MKII???

Besides lotsa Arc faults, the ACOM likes to tell me that the reflected power is too high (over 500 watts). This when I have the Icom cranked down to 5 watts out, and an SWR of about 1.5-2.5:1. This is more of a problem on 80 and 40 meters - high bands seem OK (except for Arc faults).

Yes, Everything is grounded well.

Have tried two different control lines, one with and one without a relay.

ACOM works great with my Kenwood 930
Commander Amp works great with the Icom.

I suspect there is something strange coming out of the ICOM (but don't have a scope to check it).

Thanks in advance es 73

Ted, KR1G - and yes, I love my ACOM!!

Ted:

What kind of antenna switch are you using? I have ARC faults all of the time on 10,15 and 20. It turns out that its the kachina interface that controls my Ameritron RCS-8V coax switch. As soon as I put in the supplied Ameritron control head my problem went away. I'm guessing that rf is getting into the Kachina switch/rotor controller (model 505ARX) and causing the relays to chatter a bit. Thus making the Acom think its not seeing a good load.

I didn't have this problem at 500 watts out, but now that I've gone to 1500 watts out, I've introduced new rf problems.

From: O Donnell, Glenn D (Glenn)
Topic: 98 Message: 102

The 706 does NOT have an autotuner built in. It needs an external unit
that connects to a Molex connector on the rear of the 706.

What's Ted's problem? I don't recall reading it on the reflector, but I'd
like to help if I'm capable of doing so.

103. [acom-list] Re: Acom and ICOM 706MKII woes

Yahoo group: acom-list (1999 — 2009)
Date: 1999-09-24 15:15:03 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 98 Message: 103

Oops! I'm reading me email in the wrong order, SRI. <:-(
Ignore my previous question!

According to the 2000A manual, the Arc Fault is from something intermittent on the output. I had this problem on a 75m dipole at full steam, but 1000W was OK. I'm going to rework the dipole this weekend. I suspect two conductors are too close at the feedpoint (a real Rube Goldberg attachment, I regret to admit) and the RF is indeed probably arcing across this gap.

It's good to find this stuff out now, instead of during the upcoming contest season! I never ran high power before the 2000A and I've discovered all sorts of design flaws and shoddy construction in my antenna/feed/switching system as a result. The 2000A is truly a good piece of "test equipment" for smoke testing your system!

Does the Commander push full power, too? Of course, the fact that the Acom works with the Kenwood blows my above theory.

Here's something to check. I'll do the same with my 706 when I remove it from the old Toyota truck for a contest in a few weeks. I've heard reports of certain Icom equipment transmitting a huge, but very short spike. My buddy K3II has a first generation 775DSP that did this and wreaked havoc with his 87A until he got the 775 repaired. Your 706 might have the same problem. It probably wouldn't bother a manual tune amp like the Commander, but the 2000A and 87A are smart enough to detect this as bad news and they complain about it.

A good wattmeter on the output of the 706 could show this spike. Normal drive to the 2000A for full soup is around 50W, but the spike can jump over 100W for that short burst. God knows what the 2000A's output is at that point, but reflected power, even for a modest SWR, could go above 500W easily and the Acom will kick out.

Just a theory, but one with some merit based on past Icom experience.

104. [acom-list] Acom and IC-706II

Yahoo group: acom-list (1999 — 2009)
Date: 1999-09-24 15:25:21 UTC
From: Gene @. Williamson
Topic: 104 Message: 104

The Icom IC-706MkII puts out an initial keydown spike that can go as high as 120~150 watts -- even if you have the power set at 5 watts out. I suspect this is the problem. To confirm that, apply a constant negative ALC voltage, using a 9V battery and potentiometer (you can get a diagram from ICOM, or I've got one somewhere). With a constant ALC, there's no initial spike. My '706II faults an IC-2KL amp every time; it's usable with older Clipperton L and sweep-tubers which are specced for up to 150w input.

Topic: 98 Message: 105

Thanks everyone for the responses!

No, there is no auto ant tuner in in the Icom.

And I've tried putting the coax straight to the amp - no switches etc, yet I still have big problems on at least 2 bands (40 and 80), where I have fairly new antennas and coax (less than one year old).

Its curious that the Icom706MKII works ok with the Commander (which is a full power amp).

I think the most logical assumption right now is that there is a power spike coming out of the Icom.

I haven't yet had time to play with this (using a battery and pot applied to the ALC or perhaps a more sensitivw wattmeter than I own)

Hi all - A little post-contest anecdote I thought you'd enjoy...

This weekend I operated the CQWW RTTY test. The Acom 2000A
got quite a workout - about 36 hours of almost full duty cycle
RTTY. The case barely got warm, and all is well.

Funny thing - I kept getting packet talk messages from W2YC all
weekend asking me how the amp was holding up. I told him fine,
and asked why he kept asking. He has an amp on order! (#7 here
in FRC-land, I believe)

73 Barry
BTW, I blew away the previous SOA record (but I'm sure others did
too).

108. [acom-list] TVI Problems ?

Yahoo group: acom-list (1999 — 2009)
Date: 1999-10-17 18:36:09 UTC
From: Robert Naumann
Topic: 108 Message: 108

I've read some of the archived messages and there was a reference to TVI problems with the 2000A.

Are there other users that have experienced this problem ?

Also, I'm seriously considering buying one of these things but I'm concerned about being able to "throttle it down". What I mean is that I don't always want to run legal limit and often run 500 watts or so out. Is it easy to do this with the Acom ?

Is it simply a matter of backing off on the drive ?

My manual tuned Alpha and the Titan that I used to have needed to be tuned differently as I increased drive power. Does the Acom care ?

I have both the Alpha 87A and the ACOM 2000A. The ACOM is an excellent amp but it is not as TVI free as the Alpha. I have never had TVI in my own house (DSS Sat/VCR's everywhere) with the Alpha, but I now have TVI both in my TV's and in my alarm system. I have cured most of them using traditional techniques, but have a neighbor who now has some interference when I use the ACOM.

I also have the Yaesu FL-7000 which was always TVI free as well.

Bob:

My Acom & I have had no problems with TVI.

I find that about 40 watts will provide full legal limit. I have had no adverse effects from backing off the drive to reduce the amplifier's output.

Hi Bob,

I am a proud owner of an ACOM since 9th of Oct.99,but
I have had a chance to operate ACOM amplifiers since the time
it was developed as prototype by LZ1JK and the gang here in LZ.
Currently my 20m dipole is just 80cm from one cable TV
line and 100cm from another cable TV operator's line at 28m
high roof. (here cable TV lines run on the roofs).
(Living in the center of the city does not allow me to put other
antennas at this place. Purchased a new contest QTH recently
30km away from the city).
For one week of regular operation on 20m - NOT a single
TVI complaint !!! I use a special semi automatic Tuner
made for me by LZ1OM capable to stand 2.5 kw out to
tune the 20m dipole on all other bands beside 160m and still
NO TVI with full legal power !!!

Reducing the power output of your transceiver will allow you
to operate ACOM at any desired output level without a need
to touch anything else.

Hope you will soon join the ACOM gang !

Hi Robert ,
I think I have to answer regarding TVI problems experienced from Jon Hamlet W4ZW . In order to do this I will attach a PDF file with ACOM measurements for Spurious Emissions and Intermodulation in dB relative to 1.5 kW. PEP.
I will only say that no other amplifier have better conformance to FCC requirements (97.307 and 97.317) and more clean signal.

Krassy,

Please don't get me wrong. I love my ACOM 2000. I'm simply reporting the facts here at my QTH. My installation is aggravated by the fact that I have a roof mounted tower. I have a flat roof at 43' and my tower and yagi's are above the station.

I have both my Alpha 87A and the ACOM available to either transceiver (FT-1000MP or FT-1000D) and any antenna. In a straight switch of antennas between the amps, I have TVI with the ACOM and none with the Alpha. The TVI is greatest on 80M, somewhat on 20, and marginal but noticeable on 15 and 10. Match on all antennas is 1.5:1 or better.

Maybe my ACOM has some leakage somewhere.

Based on all the evidence, or more accurately, the singularity of the evidence, perhaps there's something wrong with Jon's particular amplifier ?

It might be worth an investigation especially given that the amp from Colorado seems to behave in this installation.

Topic: 114 Message: 117

Hi everybody,

While Jon is clearly experiencing increased problems with the ACOM, we should not jump to the conclusion that the problems are a result of spurious emissions. They probably are not.

The symptoms Jon describes point toward fundamental overload - particularly the interference he reports with an alarm system. Also, the close proximity of his antenna system makes the likelihood of fundamental overload very high.

I suspect one [or both] of two possible causes.
1. The ACOM may be putting out more power than the 87A.
2. The cabling to the ACOM may have some differences.

I would try the following tests:
1. Measure the output power from both amps with an external wattmeter. Set the ACOM to the same power level as the 87A and see if there is still a problem.
2. If the problem is still there only with the ACOM, move the ACOM into the EXACT same cabling that goes to the 87A and see if the problem is still there.

By the way, I have first-hand experience with this issue:

I augmented my station with an ACOM 2000A a few months ago. I replaced a lower power Kenwood TL922A. When I moved up to the ACOM, I did experience some new interference with the smoke detectors in our house. In fact, I just cleaned that problem up this weekend! It was most definitely a problem related to the increased power output of the ACOM - fundamental overload. The interference only occured when I transmitted on an 80 meter antenna that runs in close proximity to the house.

So . . . Jon's amp is probably working just fine. He needs to study how the interference is getting into devices in the houses, and use traditional techniques to reduce their EMI susceptibility.

I can probaly help with the alarm system, if necessary. The solutions are fresh in my mind!

118. [acom-list] ACOM2000A TVI

Yahoo group: acom-list (1999 — 2009)
Date: 1999-10-18 13:46:46 UTC
From: W4ZW@home.com
Topic: 114 Message: 118

I do have a wattmeter in the antenna line and it has a peak hold reading. Both amps are set to 1.5KW output as set by the meter. Both amps are cabled to the same 220v outlet which is less than 24" from either. They are both on the same copper strap ground buss which I use throughout the station. They are mounted in a custom built enclosure with the ACOM on the bottom and the Alpha 87A on top.

The 80M antenna just now is an 80M inverted Vee, and yes the alarm system problems surfaced when I first setup the station here primarily on 40 and 80. I used toroids plus good grounding originally to clear the alarm system.

Station is on the third floor with a ground buss running vertically down an electrical chase which is bonded to the steel in the house (lot of steel in this house since I am oceanfront and built for the impact zone even though I am set back 350' from the high tide mark.) HF antennas are all about 35-45' above the station on roof mounted towers. That puts the antennas at about 98' about sea level.

I will explore the possibility that I have a leaky coax switch in the line to the ACOM. The ACOM works great! I like it much better than the Alpha 87A, especially since it has the control head which is mounted right at the operating position. The amps are in their own cabinet about 5' away. I intend to fix the TVI using traditional techniques. My original post was intended to simply report the situation here using similar amps in just about the same configuration.

Jon Hamlet, W4ZW
Casey Key Island, FL

119. [acom-list] Re: ACOM2000A TVI

Yahoo group: acom-list (1999 — 2009)
Date: 1999-10-18 13:40:52 UTC
From: Paul Hellenberg K4JA
Topic: 114 Message: 119

One other option would be to use a coaxial ground. The long bus looks like a 1/4 wave or more on lots of bands. Use a piece of 213 with a .01 1KV cap at both ends. Connect only the amp or tuner. The .01 goes between the Center conductor and the shield. This is a old trick that was identified with a 2nd floor TVI compliant.

BTW my parents no dead use to live on Casey Key then in Osprey "Sorento Shores".

Ok! This is good info. It brings to mind one other possibility. Based on your description of the GROUNDING, perhaps there is more ground-side RF flowing in the ACOM setup. Again, this could be related to the specific cabling and ground connections. Since it is a long way from your station to an earth ground, maybe it is possible that your ground path is doing some radiating?

Good luck!

Look forward to hearing what you find.

Jim

From: W4ZW@home.com
Topic: 114 Message: 121

Thanks for the tip Paul. My home is built as a commercial building would be with a framework of steel. The entire steel frame is grounded and I doubt that the ground buss looks like w/l since each floor is bonded to the building frame. It is possible I could have a ground loop back through the antennas, but nothing in the setup ahs ever indicated that other than a little RF in some headphones which I attribute to coupling with the close proximity to the antennas just 45' away at 1.5KW. A toroid fixes that easily.

Casey key is a great place as I am sure you might remember. Sorrento Shores is just across the bay from me about 2 miles north. I bike and run the Casey Key Road often. Where did they live here? I'm on the south end just 1/2 mile North of the Jetty on the ocean side. I have my dock on the bay side of Island across the street from my house.

Thanks again for the tip.

Hello Jon

I know the area sort of. I know it has changed a lot and I really never really
came down until they moved back to the main land. They moved down originally
in 1967 and I didn't come down for the 1st time until the early 1970's.
They and later I owned a building on 41 called Osprey plaza.

Everytime I saw you Casey key post I thought about writting you. Sorry it
went to the reflector. I think you may have some ground loops. In many
contest station invoirements Mine for instance. I found that ground loops
are a real problem. I have only grounded one source usually the Amps via
the method I discribed. It has really been sucessuff. I recentently sold
all my mono banders and when I get moved east, I plan to buy the 3 alphas or
Acom. That is why I am lurking around the Acom reflector.

123. [acom-list] Re: TVI Problems ?

Yahoo group: acom-list (1999 — 2009)
Date: 1999-10-18 11:23:26 UTC
From: John Devoldere (ON4UN)
Topic: 108 Message: 123

Hi to all!

I have been reading the various e-mails and the comments about the ACOM and TVI.

Not one seems to mentions whether or not the TVI seems to be caused bu fundamental overload or by harmonics or spurii. The first thing to do when comparing the "new" situation with the "old one, is to compare apples with apples. If in the "old" situation, the power was 600 Watt, and now almost 2000 Watt, then it is very possible that TVI, caused by fundamental overload will be more apparent with the ACOM (close to 2000 Watt) than with the old 600 Watt amp. This has nothing to see with the cleanliness of the signal from the ACOM amp, it is just a fact that more power means more chances of fundamental overload problems.

Personally I have been using the Acom 2000 for about 16 months now, and in many major contests, and I have never sen any trace of TV ij any of the (too) many TV sets in the house, and I have never had a complaint from the neighbours.

John Devoldere, ON4UN

From: Atilano de Oms Sobrinho
Topic: 124 Message: 124

Hi Friends:

I have been using the ACOM 2000 since December 1998, during
contests and normal operation.
Till now I never had any TVI problems or other source of
interference.
I also have a Alpha 77 DX and Kenwood TL922 and I must say
that both are not causing any problem either.
I think the most important advantage of the ACOM 2000 is the
total automatic and remote control.
The automatic tuning is faster than anyone could expect.

From: Barry Kutner
Topic: 125 Message: 125

Hi all - Something odd happened this morning...
I was on 10m SSB, went to transmit, and nothing happened.
Looked at the RCU and the frequency read 1.750-1.775. I keyed
the mic, did an "hola" and still nothing. Flipped the OPR/STBY
switch to STBY, then back to OPR, tried again and everything was
fine.
Anybody else have anything like this happen? Maybe RF getting
into the amp? (though no probs previously on any band incl. 10)

126. [acom-list] Drive Power Requirements

Yahoo group: acom-list (1999 — 2009)
Date: 1999-10-30 23:00:36 UTC
From: Richard Thorne
Topic: 126 Message: 126

Hi:

Just curious what most of you are using for drive power and is it
constant from band to band and mode to mode.

Thanks.

My Yaesu 1000 MP and Acom are single mode.... CW

Drive requirements for 1kw are:

Band / Drive in Watts
160/40 80/40 40/25 30/10 =250 Watts 20/50 17/60 15/50 12/50 10/40

73,
UCE

I guess many of us got a chance to check out our new amps pretty thoroughly this test week end. I must say it worked like a charm at this QTH. Murphy could not get in the door.

Howard, K2HK

R,R Howard:

Mine worked very well also.

Matter of fact the 2000a is turning out to be a nice piece of test equipment at the same time. It turned out that I had some antenna problems that a normal amp would not pick up. I had a very high swr on 15m that I was unaware of. I kept getting low power output on the amp and couldn't figure out why. Turns out I've had a high swr on that band in ssb only which will require me to adjust the driven element on the F12 C4XL.

I also had a big problem on 40 meters. Now my receiver would have caught this anyways, but its nice that the amp can shut itself off. One of the wires between my balun and driven element broke. Instant no receive. But, like I said the amp, protected itself and let me know there was a problem.

The balun has been fixed, and since 15 is ok on cw I'll worry about it later. See you all in Nov. SS CW this weekend.

131. [acom-list] SSCW Observation

Yahoo group: acom-list (1999 — 2009)
Date: 1999-11-10 05:41:03 UTC
From: Robert Naumann
Topic: 131 Message: 131

First, I started the SS late, had problems with my two-radio switching arrangement, and was depressed as I knew that at 25 minutes into the contest and I had zero qsos in the log, it was basically over.

I did operate somewhat aggressively for the next several hours, and the Acom was working well. A couple of times, I forgot to change antennas and it protected itself, and straightened me out. Later on, I had a strange occurrence where my amp shut down due to high-voltage being too low.

It shut down, the screen went dark and it said the high voltage was too low.

I restarted the amp and it only had a 32 second delay to go through. It completed, looked like it would start up OK, but then failed again saying high voltage too low, .09 kV.

I thought that I might have blown a fuse, but had not.

I decided to stop fooling around with it after wasting an hour of operating time and went back to using my host's Ameritron AL-1200.

About 3 hours later, I decided to try it again and this time it came on - no problem ! (?)

Is there a thermal cut-off in the transformer ? Elsewhere ?

I got a small fan, sat it behind the amp, blowing into the spot where the optional fan would be, and operated the rest of the contest without incident.

The temperature of the tubes measured anywhere from 30 to 60 C. It was somewhat warm in the shack Sunday afternoon, and while I was CQing a lot, the temp got up to 60.

Any idea what happened ?

73,
Bob

133. [acom-list] ACOM 2000A Wattmeter Information

Yahoo group: acom-list (1999 — 2009)
Date: 1999-11-11 13:28:49 UTC
From: Jim Idelson
Topic: 133 Message: 133

Many of you have asked about how the ACOM 2000A wattmeter works. Here is some information on this subject:

1. The amplifier's LED bar forward and reflected indicators show Peak Power.

The digital RCU wattmeter reads the same but at a lower rate (about one sample per second).

Therefore, in SSB and CW the LED bar is more useful. For metering purposes, use the digital readouts with long CW keydowns. The typical accuracy is ±10% when readings are in the 30-100% full-scale range. It shows negligible dependance on the real antenna VSWR.

2. Of course, the real output power to the antenna is always equal to the difference between the FORWARD and REFLECTED (LED bargraphs and digital readings, too).

For instance, at indicator readings of 1800W FORWARD and 300W REFLECTED, the real output power is 1500W. At very high VSWR (lack of antenna or a shortened antenna), the FORWARD and REFLECTED readings will be almost equal, while the real output power (their difference) will be practically zero.

3. Note that the REFLECTED and VSWR readings depend only on the antenna impedance. They are independent of amplifier actual tuning settings. If the antenna impedance is different from 50 Ohm pure resistive, the REFLECTED POWER bargraph will always indicate the reflected power presence (even at actual user tuning).

4. If you want to check the accuracy of the built-in wattmeter with an external one, please keep in mind the following considerations:

a) Due to the inevitable presence of some ripple in the HV rectifier, when the power is increased above a certain limit, the 100/120Hz pulses begin to modulate the output signal (because the plate RF peak reaches the DC supply).

Of course, if the output signal is modulated (even slightly as in the case, and even a long CW keydown instead of SSB is applied), the signal's Peak Power is greater than its Mean Power. Note which kind of power is indicated on the wattmeter you use (for instance, the very popular BIRD Model 43 reads Mean Power). As described above, at lowered mains voltage and at higher power levels, the difference can be increased unless a peak reading wattmeter is used.

b) The metering error of most Thru Line Wattmeters you may find on the market is very often well above ±10% f.s. The best models are ±(8-10)% and only the types using the substitution calorimetry method can have accuracy better than ±5% (they read Mean Power).

c) Anyway, up to 1700-1800W and good mains voltage, the maximum error in the built-in wattmeter should be less than ±10% if you would compare with a good Peak Power Wattmeter. Using a Mean Power Wattmeter, the difference could reach +10/-15% (because of the ripple) or exceed -20% in some conditions as described above.

5. Do not undertake on your own recalibration of the built-in wattmeter unless you are abslolutely sure about your external wattmeter and dummy load accuracy. The LOAD capacitor control during auto tuning procedure depends on the built-in wattmeter accuracy.

Bob,

I'm only guessing - it sounds like the amp protection circuits worked correctly. Possibly, the measurement that tripped the protection [yes, it could have been thermal] might not have returned to acceptable range in the short 32-second delay. I'll bet it would have come back to life within a few more minutes if you had given it a try.

136. [acom-list] Re: FWD: SSCW Observation

Yahoo group: acom-list (1999 — 2009)
Date: 1999-11-13 02:02:30 UTC
From: Bob Naumann - N5NJ
Topic: 135 Message: 136

I actually tried it several times over the course of an hour or more after taking it apart and removing the transformer to see if I had blown a fuse and re-assembling it two or three times. I also checked to see if perhaps I did not have the main voltage taps set properly. I did have them set properly, and they're set for 240v. Afterwards, I monitored both the line voltage (mains) and the high voltage simultaneously (a very cool feature by the way). The line voltage was pretty steady at 240v or so(238 to 245). I don't recall the exact value of the HV but it was pretty steady too. From how little the HV dropped when in transmit, it appears as though the transformer is pretty well made.

It was not obvious to me that the amplifier was in a "protect mode" and it just appeared as though the High Voltage was missing. I certainly would have felt better if it said that it was in a "thermal protect mode" and to wait for it to cool down - for 15 minutes ? 30 minutes ?. I'm installing the 24v fan tomorrow.

What kind of thermal protection is in there and where is it ? Is it inside the transformer or is it external ?

I really thought that it was shot and I was going to have to ship it back.

Topic: 135 Message: 137

ACOM Devotees: I received the following note from Krassy, K1LZ. I've edited it somewhat, but this portion addresses my "problem". Krassy also called me on the telephone to discuss this problem. How's that for customer service ? I have some other comments at the end based on our telephone conversation.

Here's the email:
****
Hi Bob ,

This is very simple. When you install the transformer, there are several couplings which have to be plugged together very well. Please open the amplifier and
make sure the that the big white coupling near the rear panel is plugged together very well. Open it and check the pins inside. Some time the male pins push the female out and they no longer make
good contact.

What happened is you lost the HV totally because this transformer connection.

Just check the coupling and you will be OK!

Krassy K1LZ

****

Krassy also told me that there is no internal thermal cutoff in the transformer. I was guessing that this might be the case, but in fact, what happened was most likely related to the Molex primary voltage connector on the high voltage transformer. That transformer does not provide the voltage to the remainder of the amplifier. If the Molex connector was totally unplugged the result would be the same. In other words, the other, small transformer provides the balance of voltages to the amplifier.

Thanks Krassy !

73,
Bob

139. [acom-list] Acom in ARRL 160 CW Contest

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-06 00:53:40 UTC
From: Jack
Topic: 139 Message: 139

First work out for my new Acom in the ARRL 160 CW contest - 949 QSO's. The amp performed without a flaw except I needed to increase the air flow space in my console to maintain temperature range. My fault not the Acom.

What a pleasure it was to run QRO and be heard. If we heard them, we worked them.

Also installed the QSK keying line between my Yaesu FT 1000MP and the ACOM as recommended in an earlier posting to eliminate using the MP relay and eliminate relay clicks. A great improvement that is simple to implement and it works like a charm.

Thanks Acom...

140. [acom-list] The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-14 21:17:45 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 140 Message: 140

Some time ago, someone posted here that he was having problems
with his Acom amp kicking out with ARC FAULT while using his Icom
IC-706MkII as an exciter. Many responded, including me, that it might
be due to the spikes that have become notorious from some Icom gear.
I don't recall what he did to solve the problem, but apparently, I am also
suffering from the same issue with my IC-775DSP.

My friend, and idol, K3II purchased an early model 775 and it has been
a nightmare for him. After several trips to Icom for repairs, and enough
money to buy a new mid-range rig, his seems to be OK. His was kicking
out his Alpha 87A and it was found to be due to the spikes from the 775.
We tested mine at the time, and it appeared OK.

Fast forward to August 1999. I bought my Acom amp and I was delighted
to finally join the big boys. I was on top of the world because I was now
jumping into pileups and kicking some serious butt! The first time I had an
opportunity to beat the amp up for an extended period was during the
Pennsylvania QSO Party in early October.

We used my QTH for the W3HA multi-multi and my 775/2000A combo
was the 40m/75m SSB station. It seemed to perform well at the start on
40m, but then it started kicking out on me. I blamed the 40m antenna we
were using. We had to reduce power anyway because of interstation QRM,
so the "problem" went away.

At this point, I wasn't sure what was going on. I had a lot of other
problems
since going to high power and most of them were due to sloppiness on my
part. I fried a 90-degree coax adapter, I hung the computer from too much
RFI, I had to rebuild the feedpoint for my 80m dipole, etc. All were fine
with
low power, but all of this extra RF required me to really tidy things up.
Suddenly, station design and construction is a whole new ball game!

Two weeks later, I'm in the CQWW SSB Contest and trying to make the
Top Ten SOA USA. Ten meters was the prime band, but my numbers
suffered on 10m because my 10m yagi is too high and ... the amp was
kicking out like crazy. I was able to S&P, but it was impossible to get
a run going. I switched in my Butternut vertical and it appeared to be OK.
I suspected trouble with my 10m yagi, which, of course, is at the very
top of the mast on my tower and any repairs will be difficult. While the
vertical seemed fine, it doesn't perform well enough to sustain a run on
a crowded band, even with high power.

After the contest, I did some testing on 10m. I ran Europeans on 10m
phone for over an hour and everything performed perfectly. Arrrggghhh!

My next real contest was CQWW CW. Here, 10m worked well, but
40 and 160 were nasty. My 40m dipole was trouble, but the Butternut
seemed to do well, so I used the vertical on 40m. The 160m problem
kept me from doing any more than 600W or so. I later found the 160m
problem was from another sloppy move on my part. Some crude wiring
I tried in my antenna switching was picking up RF and switching the
Top-Ten relay box in cadence with my CW! This was an easy fix.

This past weekend, I began the ARRL 10m Contest and the Acom kicked
out on almost every transmission with ARC FAULT. I reduced power and
kept going with little trouble. About 1.5 hours into the contest, my
computer
locked up and I lost my log, but that's another story. The amp problem got
worse. Since the contest was slowing down late Friday night, I dug into
the problem more. It appeared that I was getting those hideous spikes from
my 775. I have an Icom IC-736 as a standby rig, so I swapped out the 775.

Bingo! The Acom was able to put out full power without once complaining!
It's NOT my antennas. It's the multi-kilobuck 775 causing all of this!
Mine
is one of the "newer generation" that is supposed to be free from all of the
bugs in the early models. I used the 736 for the remainder of the contest.
The receiver is terrible compared to the 775, but at least I could TRANSMIT!
I did well for the time I put in, but my antenna is still too high. On 20m
and
15m, I'm an animal, but I often have to fight on 10m.

You learn something new every day! Now, if I get a lower 10m antenna,
I can take another shot at the Top Ten box in the ARRL DX contests.
In the meantime, I guess the 775 is going back to Icom for a tune-up.
Does anybody have any alternatives to shipping this thing back to Icom?
I'm really not thrilled about doing this if I can avoid it!

While I'm here, MERRY CHRISTMAS and HAPPY NEW YEAR to all
of my fellow radio nuts and their families! May you all survive the
apocalypse
and join me in the ARRL RTTY Roundup! :-)

141. [acom-list] New ACOM Amp?

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-15 08:57:06 UTC
From: Larry Crim
Topic: 141 Message: 141

Just read in QST that an upcoming expedition to Pitcairn Island is going to be using a prototype of an Acom 1kw 160-6m amp.

Is this likely the next available product? Can someone tell us about it?

73,
Larry K4AB

142. [acom-list] SV: The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-14 23:06:15 UTC
From: sm5ki
Topic: 142 Message: 142

Maybe this will help:

My IC 735 I had before worked fine barefoot on my windom antenna with a 30 meter coax. But as soon as I increased my power with a SB 1000 the whole setup became unstable. The windom is unsymmetrical so I suspected rf floating along the coax. Using a batterydriven fet voltmeter as a rf sniffer (it was very rf sensitive) I found rf all around the place including the microphone cable.
The shield of the coiled microphone acted as an antenna and it was grounded INSIDE THE RIG via some sort of very small choke. The short wire to the ground lug inside the panel radiated enough to inject rf into some low level stage at the output frequency and you got an oscillator at the peaks of my SSB.

The solution was very simple and it cured the problem 100%: What I did was grounding the cable shield on the outside of the panel: soldered a bare wire to the pin the shield was soldered to in the cable microphone contact. This wire was then simply clamped under the cable clamp. Voila, I never got this problem again.

I published my findings in our swedish magazine QTC and got reports from other IC 735 owners it cured their similar problem. Even owners of other ICOM models reported it cured instability in their set-up. Now, before trying this very simple and effective cure, check your schematic that you do not make any mistake - you may ground some vital part.

Let me hear if this at any help, will you?

143. [acom-list] SV: The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-14 23:06:15 UTC
From: sm5ki
Topic: 142 Message: 143

Maybe this will help:

My IC 735 I had before worked fine barefoot on my windom antenna with a 30 meter coax. But as soon as I increased my power with a SB 1000 the whole setup became unstable. The windom is unsymmetrical so I suspected rf floating along the coax. Using a batterydriven fet voltmeter as a rf sniffer (it was very rf sensitive) I found rf all around the place including the microphone cable.
The shield of the coiled microphone acted as an antenna and it was grounded INSIDE THE RIG via some sort of very small choke. The short wire to the ground lug inside the panel radiated enough to inject rf into some low level stage at the output frequency and you got an oscillator at the peaks of my SSB.

The solution was very simple and it cured the problem 100%: What I did was grounding the cable shield on the outside of the panel: soldered a bare wire to the pin the shield was soldered to in the cable microphone contact. This wire was then simply clamped under the cable clamp. Voila, I never got this problem again.

I published my findings in our swedish magazine QTC and got reports from other IC 735 owners it cured their similar problem. Even owners of other ICOM models reported it cured instability in their set-up. Now, before trying this very simple and effective cure, check your schematic that you do not make any mistake - you may ground some vital part.

Let me hear if this at any help, will you?

144. [acom-list] Re: The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-15 03:29:58 UTC
From: ted demopoulos
Topic: 140 Message: 144

I was the one who posted about the probs. Was running an ICOM 706MKII to the ACOM, and getting lots of ARC FAULTS.

The suggested fix was to put a small negative voltage (approx 6volts, maybe a 9 volt battery and a resistor??) to the ALC of the ICOM.

Never tried it, instead I got my Kenwood back out of the shop and am using that with the ACOM - the baby ICOM was just a temporary situation.

73,
Ted, KR1G

145. [acom-list] Re: SV: The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-15 04:18:19 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 142 Message: 145

Thank you Hans!

I'll look into this on my radio. I don't suspect this is MY problem, but
it's
interesting that Icom would have such a nasty design flaw like that.
You never know. I'll check mine.

I received some other suggestions that might lead me to a solution.
I'll be trying a few ideas over the next day or two and report back to the
list.

I wish you and your family a very happy holiday season!

146. [acom-list] Re: The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-15 04:21:49 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 140 Message: 146

Hi Ted,

Thanks for the ALC suggestion! Someone also suggested I fiddle
with the "Drive" control to see if that helps. That's a simple one that
I can do tomorrow. I hope that fixes it! It does sound reasonable that
the Drive control may be a contributing factor. If I'm overdriving the
rig's final stage, the output would be unstable and wreak havoc with
the amp.

Someday, I'll have to take my 706 out of my truck and try it on the
Acom to see how it behaves.

73 de Glenn K3PP

Yes, I know they should have this amp available soon.

148. [acom-list] Re: [FRC] The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-14 23:15:05 UTC
From: Tony Kazmakites
Topic: 140 Message: 148

I saw the same thing happen at V26B with the Alpha. What I do to get around that sort of problem is to use the +12V "transmit" signal that is available on the back of my Kenwood 950SDX and my Icom 751A. I use this signal to drive a power mosfet which in turn keys the amp. I have used both rigs with an Alpha and Acom without any problems that you are seeing. Not sure if this signal is available on all rigs. Not sure if the problem of spikes is caused by RF on the output of the rig before you get closure on the relay in the rig which is keying the amp.

Subject: [FRC] The dreaded "Icom Spikes" (fairly long)

Some time ago, someone posted here that he was having problems
with his Acom amp kicking out with ARC FAULT while using his Icom
IC-706MkII as an exciter. Many responded, including me, that it might
be due to the spikes that have become notorious from some Icom gear.
I don't recall what he did to solve the problem, but apparently, I am also
suffering from the same issue with my IC-775DSP.

My friend, and idol, K3II purchased an early model 775 and it has been
a nightmare for him. After several trips to Icom for repairs, and enough
money to buy a new mid-range rig, his seems to be OK. His was kicking
out his Alpha 87A and it was found to be due to the spikes from the 775.
We tested mine at the time, and it appeared OK.

Fast forward to August 1999. I bought my Acom amp and I was delighted
to finally join the big boys. I was on top of the world because I was now
jumping into pileups and kicking some serious butt! The first time I had an
opportunity to beat the amp up for an extended period was during the
Pennsylvania QSO Party in early October.

We used my QTH for the W3HA multi-multi and my 775/2000A combo
was the 40m/75m SSB station. It seemed to perform well at the start on
40m, but then it started kicking out on me. I blamed the 40m antenna we
were using. We had to reduce power anyway because of interstation QRM,
so the "problem" went away.

At this point, I wasn't sure what was going on. I had a lot of other
problems

since going to high power and most of them were due to sloppiness on my part. I fried a 90-degree coax adapter, I hung the computer from too much RFI, I had to rebuild the feedpoint for my 80m dipole, etc. All were fine with
low power, but all of this extra RF required me to really tidy things up. Suddenly, station design and construction is a whole new ball game!

Two weeks later, I'm in the CQWW SSB Contest and trying to make the Top Ten SOA USA. Ten meters was the prime band, but my numbers suffered on 10m because my 10m yagi is too high and ... the amp was kicking out like crazy. I was able to S&P, but it was impossible to get a run going. I switched in my Butternut vertical and it appeared to be OK. I suspected trouble with my 10m yagi, which, of course, is at the very top of the mast on my tower and any repairs will be difficult. While the vertical seemed fine, it doesn't perform well enough to sustain a run on a crowded band, even with high power.

After the contest, I did some testing on 10m. I ran Europeans on 10m phone for over an hour and everything performed perfectly. Arrrggghhh!

My next real contest was CQWW CW. Here, 10m worked well, but 40 and 160 were nasty. My 40m dipole was trouble, but the Butternut seemed to do well, so I used the vertical on 40m. The 160m problem kept me from doing any more than 600W or so. I later found the 160m problem was from another sloppy move on my part. Some crude wiring I tried in my antenna switching was picking up RF and switching the Top-Ten relay box in cadence with my CW! This was an easy fix.

This past weekend, I began the ARRL 10m Contest and the Acom kicked out on almost every transmission with ARC FAULT. I reduced power and kept going with little trouble. About 1.5 hours into the contest, my computer
locked up and I lost my log, but that's another story. The amp problem got worse. Since the contest was slowing down late Friday night, I dug into the problem more. It appeared that I was getting those hideous spikes from my 775. I have an Icom IC-736 as a standby rig, so I swapped out the 775.

Bingo! The Acom was able to put out full power without once complaining! It's NOT my antennas. It's the multi-kilobuck 775 causing all of this! Mine
is one of the "newer generation" that is supposed to be free from all of the bugs in the early models. I used the 736 for the remainder of the contest. The receiver is terrible compared to the 775, but at least I could TRANSMIT! I did well for the time I put in, but my antenna is still too high. On 20m and
15m, I'm an animal, but I often have to fight on 10m.

You learn something new every day! Now, if I get a lower 10m antenna, I can take another shot at the Top Ten box in the ARRL DX contests. In the meantime, I guess the 775 is going back to Icom for a tune-up. Does anybody have any alternatives to shipping this thing back to Icom? I'm really not thrilled about doing this if I can avoid it!

While I'm here, MERRY CHRISTMAS and HAPPY NEW YEAR to all
of my fellow radio nuts and their families! May you all survive the
apocalypse
and join me in the ARRL RTTY Roundup! :-)

150. [acom-list] SV: The dreaded "Icom Spikes" (fairly long)

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-17 17:55:42 UTC
From: Rune Wande
Topic: 142 Message: 150

Hi glenn!
Always nice to read your stories but too bad you had such problems.
I hate things when something does not work. I hate troubleshooting ...
I've had the Acom since December 1998 and works fine. Using my
old TS940s and have never had any spike problems. Lights are
blinking too much so I usually run about 1 K output. That is the power
limit here in SM so why bother to run more, Hi!
I met Vasko LZ1JK in Friedrichshafen Germany at the Ham Radio
this past June. A nice guy but difficult to speak with as he did not speak
english. His wife spoke a little but my friend LZ1AF helped us out.
By the way, I just got a nice Xmas card from Vasco, the owner of Acom.
I wish you good luck with you setup and I hope that the troubles are
over now.
See you on the bands. In constests I nowadays use my new contest
call 7S5Q and for regular QSOs SM5COP. I also have KB1Q but I
do not get to use that very often although I have been to the USA five
times since May this year! Just quick business trips and does not
give me time to operate the ham bands or even visit any hams ...
Too bad! Anyway I got on the air for 26 QSOsa in October as KB1Q/9.
See you!

151. [acom-list] Holiday cards from Acom

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-18 13:50:22 UTC
From: Bob Naumann - N5NJ
Topic: 151 Message: 151

I just received a rather attractive card from Vasco as well.

I presume all Acom owners are receiving these cards.

Nice touch !

Here's to Y2K !
73,
Bob N5NJ / V26O

(P.S. no spikes from my TS850SAT or FT847. Both rigs run the Acom
very well.)
(P.P.S. What's this new Acom amp being rumored ?)

Robert E. Naumann N5NJ@...
N5NJ / V26O
Plano, TX USA
ex KR2J, V26RN, W6V, WA2OVE

From: GIG38@aol.com
Topic: 155 Message: 156

Was only joking about the card, if it comes it comes if not no big deal. My Acom works very well for which I am most pleased.

Being from Zero Land, born in Iowa and lived in Colorado and Minnesota, North Carolina winters without snow, ice and freezing temepratures are a pleasure. Snow does set the mood for Xmas however. Today I finished another beverage and wore only a long sleeve shirt outside. Hi Hi.

Wishing you and yours a joyous Christmas and the best that Y2K can bring.

73,
Jack W0UCE
Raleigh, NC

157. [acom-list] COLD BRRR

Jack,

Speaking of Zero land. Are you referring to temperature or call area? :-)!
I am sending this from Lake Placid, NY where the 6AM temp was -11.
I had to pass my coax thru a cable heater to unfreeze the RF on the way to
the antenna.:-)
Merry Christmas
73
Howard, K2HK

Happy Holidays. You think that is bad, when I lived in IA and MN I use to intentionally run high SWR just to keep the shack warm....

Grew up in that wintery mess, wading snow to school, home for lunch, back to school and home afterward. Now spoiled but loving it in NC....

Merry Christmas and Happy Holidays
to Acom owners from sunny Bulgaria.
Temeperatures here are unbelieveable -
13 deg C . We have never had this
during last 112 years.
Anyway we pray for a snow during
Christmas (especially my two daughters - Hi)
because what is Xmas without a snow ????

Wish you all the best in a comming 2000
and watch for new things comming from
ACOM next year !
See ya in a WPX SSB in March.

Topic: 142 Message: 164

Thank you Rune,

I have been busy preparing for the holidays, so I have not been able to do much testing of my IC-775DSP on the Acom again. I did a small bit of testing one morning and worked some Europeans on 10m SSB and CW. Everything worked very well at full power, regardless of the Drive control setting on the 775. I need to run the system for a more extended period of time to see if I can reproduce the problems that have haunted me during contests.

Anyhow, I must get back to holiday preparations. I always delay this activity to the very end, sigh!

BTW: I also received a VY FB Christmas Card from Acom!
Small gestures like this mean a lot to customers. Having an excellent product also doesn't hurt!

1999 has been a fabulous year. Thanks to Acom and thanks to my fellow radio enthusiasts. Merry Christmas and may Y2K be even better than Y1.999K!

Yes those Christmas cards were great. Please pass on my 73 to Vasco and the gang. Tell him not to wait too long before telling us about the new amplifiers, and sending us the samples for CE testing! We arent going to have any snow here for the kids, but it is DARN cold!

Hi Ron,

73's to Vasko have been passed.
They are working on new amplifier and the
prototype will be tested during the Pitcairn
Isl. DX pedition ,if all goes well.
The rest will come a bit later.
After having 13 deg C ,last night finally
the snow came here and my daughters are
happy ! Moreover ,it is going to be a REAL
Xmas here with temeperatures of - 10deg C
right on Christmas night.

Best wishes for new millenium to all Acom list members.

168. [acom-list] Icom 775DSP problem with Acom 2000 ??

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-22 23:42:06 UTC
From: Will, K6NDV
Topic: 168 Message: 168

Hello, I am on the edge of ordering the Acom 2000A with the antenna switch.
After seeing the Acom"reflector" I am kind of scared to do the order.
I have a Icom 775DSP this is my second unit, the first one was replaced by
Icom because of all the problems I had with the rig. The one I have now is
also a early model but it has been upgraded by Icom before they send it to
me (this is all a few years back.)
I use to have a Alpha 77 and that on kicked out just once in a while. I sold
that one and now I have the Alpha 91B and never! yet had it kick out on me
yet.
Please give me some input about this, I hate to sell my 91B and buy the
Acom, then to find out some sort of trouble.
Thank you 73 Will, K6NDV

Hi Will,

I'm convinced the problem is the 775, NOT the Acom. In fact, the Acom is doing
exactly what you'd want. It's kicking out to tell you that something is awry and
it needs to be fixed. In fact, I'm surprised that you don't hear about people who
have damaged amplifiers due to these spikes from the 775. The Acom is doing
a self-defense maneuver. The 87A will also, but manual amps usually do not
complain on these short-duration events.

I've received several good suggestions regarding my situation with the 775 and
the Acom 2000A. Since I've been scrambling to prepare for the holidays, I've
had little time to try most of these suggestions.

One good suggestion was to turn down the Drive control on the 775. This one
I did experiment with a bit, but the station ran flawlessly regardless of the Drive
setting. I only had short spurts of time to work on it, so I probably need a more
rigorous test to reproduce my problematic results and adjust accordingly.
I will make time next week to work on this and report to everyone.

My suggestion to you is to try your 775 on someone else's Acom or 87A
and see if it's producing these spikes. A good peak-reading wattmeter might
work too, or if you're really resourceful, use a good sampling oscilloscope.
Yours might have this problem fixed. If so, you have nothing to worry about.
The 775 is otherwise an extremely FB transceiver and the Acom 2000A is,
without a doubt, the best amplifier on the market.

Happy whatever-it-is-you-celebrate to everyone on this reflector!

73 de Glenn K3PP

P.S. I received a new fan bezel for my 2000A yesterday from Acom.
It has a screen on it to filter out bugs, dirt, etc. from getting sucked into
the amplifier. Gee, that would make quite a bug-zapper, wouldn't it?
Thanks Acom! I'll do this after Santa makes his rounds here! :-)

Topic: 168 Message: 170

Hi, I have no doubt at all that the Acom is a good (excellent) amplifier and the problem is definitely a Icom problem even the 706 is giving a nasty spike.
Tom W8JI has done some testing and came up with some bad results for Icom.
I just want to find out or it is going to be a big problem and if so is it fixable, I still WANT this amplifier!.
I looked closely with the new RF Application watt meter in tune mode and did see not any spikes so mine might be fixed by Icom before they send it to me (the 775DSP came straight from Washington).
Thank you for the input.
Happy holidays and all the goodies (hope for me it is the new ACOM 2000A

Hi Will,
Let me know when you finally get an ACOM amp. I am considering
buying one
but I want to see how they are built inside and have not been able to
hook up
with anyone locally that has one that I could look at with the covers
off. My inclination is to
just wait til Dayton and see it there and then buy it, hopefully at a
Dayton discount too !

73, Dennis N6KI

172. [acom-list] Re: Icom 775DSP problem with Acom 2000 ??

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-25 10:45:39 UTC
From: Will, K6NDV
Topic: 168 Message: 172

Dennis, I am planning to make the order soon (NOW?).
I also will get the antenna switch box if they give me a good deal.
I will let you know.
Not much learned about my Icom spike question thou, but I just will take the
risk.
I already down loaded and printed the manual and it looks pretty darn good.

Hi Will,
Let me know when you finally get an ACOM amp. I am considering
buying one
but I want to see how they are built inside and have not been able to
hook up
with anyone locally that has one that I could look at with the covers
off. My inclination is to
just wait til Dayton and see it there and then buy it, hopefully at a
Dayton discount too !

Hello Jim,
Happy New Year!
I am still looking to view the inside of an ACOMM 2000 so keep me in mind
if you sell one in the So Cal area where the owner wouldn't mind popping
the
covers....otherwise I guess I can just wait to see one at
Dayton.............
The sooner I see what I want ot see the sooner I get to buying one......

175. [acom-list] Grimeton ancient transmitter on the air

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-27 23:39:27 UTC
From: sm5ki
Topic: 175 Message: 175

The very last (as far as I know?) 17.2 kHz Alexandersson transmitter in the world will be on the air the first days of 2000. On January 1st at 12:00, 12:30 and 13:00 and on January 2nd at 0600 - all UTC. Each transmission is expected to last about 10 minutes.

There were once a chain of these antique transmitters built in the twenties and constructed by the Swede Alexandersson. Radio frequency was generated by
motors with a special technique and enabled reliable communication all over the globe and could be heard by submarines under the water during WW2.

The QTH is Grimeton on the Swedish west coast. If you pass bye, you can't miss
the station, as the antenna is a couple of kilometers long on high towers. This fantastic station is now a museum and visitors are welcome. Our Taeby club was there a couple of years ago and yours truly had a chance to send a couple of v v v. I will never forget the v-sounds of the generator and the flashes along with my keying on the old CW key! If you remember the old Frankenstein
Monster Movies, then you can imagine what it looked like with those big handles and switches. The tuning rods going up and down in the water while the transmitter was tuned - up.....

Listener reports may be send to:

Radiostation Grimeton
Telia Mobile,
Pl 3118,
Rolfstorp 430 16
SWEDEN
Phone: 0340-67 42 51
Fax: 0340-67 41 95
grimeton-radio@...

But there will be also 7S6SAQ QRV from Grimeton January 1 and 2 2000 around 0800 - 1400 GMT on 14040 CW and 14280/3750 SSB.

Antenna used will be a commercial log-periodic pointed at present to the south. Due the very high noise level at Grimeton the receiver may be remote-controlled from another site. QSL-adress is via the bureau. In case you want to send your card direct to the Swedish QSL-bureau, here is their adress:

SSA
PO Box 45

SOLLENTUNA 191 21
S w e d e n

You are welcome to listen to SAQ the Sound of Radio History! You can't miss it, as conditions are always reliable on that frequency.

73s de Hans SM5KI

176. [acom-list] Filter Upgrade

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-28 01:10:48 UTC
From: Richard Thorne
Topic: 176 Message: 176

Another nice touch from Acom.

They just sent me a filter upgrade. Its a filter that covers the hole where the filter goes. It will keep out dirt/dust ect.

The best part its free of charge and no request was made, it was just sent.

179. [acom-list] Rumors of the death of Amateur Radio are premature!

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-30 22:29:54 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 179 Message: 179

Hi everyone,

I just heard, as did many of you, that the FCC's Amateur Service restructuring
is now official. I downloaded the PDF file of the FCC's Report and Order.
It's big, so it will take a while to digest.

Before we all start mourning the death of our beloved hobby, I want to inject
some comments of hope.

This restructuring will NOT turn Amateur Radio into another CB "service"
unless we (all of us in Amateur Radio) allow it to deteriorate. The future of
Amateur Radio is in OUR hands, not those of the FCC, the ARRL, nor the
IARU. These bodies will only do what we want of them and numbers count.
He who has the most votes on his side wins. If you disapprove of any
outcome, your camp was in the minority. That's what democracy is all about.

We have to face two facts. One, the world is changing and we must change
with it. Two, the FCC has laid down the law and we must all abide by it,
whether we like it or not. What's done is done. Now we must all move on.

If WE want Amateur Radio to remain a happy, cordial fraternity, WE must
actively work to promote growth in our numbers as well as growth in our
activity. Sitting on the sidelines, grumping about the way "it was" and the
general decay of our hobby will only accelerate the demise of this most
wonderful of pasttimes. Our future is a self-fufilling prophecy. You and I
and all of our fellow hams need to keep a positive attitude about the
future.

So, where's the good news? The FCC has gotten tough about enforcement.
This alone will help moderate the general conduct of the bands, but WE still
need to help. Despite the so-called decline in our numbers, the activity in
contests has skyrocketed. The "dead" mode of CW is wall to wall in the CW
contests. We ARE out there and we ARE active. Despite the explosion of
cellular phones and other wireless services, it is STILL the hams who come
through in big disasters. I could go on, but the reality is that we can keep
this thing going and growing if we want it bad enough. It won't take a lot of
effort, just a unified and pervasive attitude of hope, not despair..

Make a New Year's resolution to do at least one thing to grow our hobby.
Get some kid excited about Amateur Radio. Assume a leadership role
in your local club. Organize a special event station at a local mall.
Become an evangelist for some aspect of the hobby you particularly

enjoy, like contesting, QRP, or public service. Get the media involved.
You get the idea!

I look forward to the future! I hope you do also! We WILL survive Y2K
and we WILL survive Amateur restructuring!

73 ES Happy New Year!
de Glenn K3PP

180. [acom-list] Re: Rumors of the death of Amateur Radio are premature!

Yahoo group: acom-list (1999 — 2009)
Date: 1999-12-30 22:58:11 UTC

Hi Glenn, and everyone else:

As moderator of this list, which fortunately has needed no moderation since everyone has been so well-behaved, other than occasional housekeeping chores like fixing bounced e-mail addresses, etc, I respectfully request that we not discuss FCC restructuring here.

First, this is a forum for discussion of Acom products.
Second, out of the 65 current list members, about 1/3 are not in the US.
Third, we're going to see and hear enough about it elsewhere for a long time.

Thanks es HNY2K,
Barry W2UP

After some UPS related delays the Amplifier is here.
I have been reading the write up about this amplifier for some time and all what has been written is absolutely true! (thanks ON4UN and W2UP and others)
Last night at 9:30 EST! Krassy called me and stayed on the phone for 45! minutes to "walk" me true the whole process.
I also have the Acom2000SW/Acom2000S and I don't have to do anything any more all I do is change the band on the radio and the rest is done.
I will tell more later, I am just excited about this amp.

Topic: 184 Message: 184

Well I had some time off from work today and "pleyed" around with the amp some more.
This amplifier is absolutely a joy to play with, I did all the "users" tuning and have full++ power out on each band.
Yes indeed the Icom 775DSP is not a good radio for this amp and indeed I do have the SPIKE, I am going to deal with this tomorrow.
The service from Acom is GREAT looks like Krassy never sleeps.....hi.

189. [acom-list] Re: Acom 2000SW Antenna Switch

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-05 16:42:57 UTC
From: Richard Thorne
Topic: 186 Message: 189

Hi Will:

I'm trying to find out if there is a way (and I'm sure there is) for the antenna switch to track bands so it selects the correct position for the band I'm on.

I'm running remote control, so I need to be sure the switch will track with the amp without any additional software.

I also wonder if the switch will track if the amplifier is off. I dont' this this is possible, but if it was I could run barefoot and still have control of the switch.

The key to all this is that its automatic, since I'm 6 miles away from the station while operating.

190. [acom-list] FIXED!!! " MICROPROCESSOR CONFLICT" ERROR

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-16 04:26:23 UTC
From: Turkisher Dan-CSLC82
Topic: 190 Message: 190

Great news! Thanks to the fantastic and prompt service of Krassy @ Acom,
this problem has been resolved.

The "microprocessor error" indicates that the RF unti and the remote control
unit are not communicating with each other. In my case, I apparently got the
two units a few inches too far part, stretched the remote control cable, and
must have pulled one of the wires in the serial connector. I did inspect the
connector, saw nothing wrong, and continued to have the "conflict" problem.
I sent the unit to Acom and Krassy found one of the wires separated inside
the insulation, fixed it promptly, and shipped the unit back to me.

The problem is fixed and the amp is working fine again.

My hats off to Acom for their prompt and professional service!

Krassy: Many thanks!

191. [acom-list] Acom2000A update

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-20 20:58:15 UTC
From: k6ndv@contesting.com
Topic: 191 Message: 191

Well finally, I can joy my new Acom2000A amplifier, all is working flawless.
After spending some time and money with Icom America, I now have a new Icom IC-775DSP and this one is working as it suppose to work, NO spike.
My old IC-775DSP was one of the first ones in the USA.
I also have tried my IC-706 with the amplifier but that is as useless as can be, 20 watts gives a spike of about 175 watts! At first key up and the amp does not like that at all so it goes in protection mode.
I did send it back to Icom also but they insist that there is nothing wrong with it and there is no cure for the spike.
Also I had a bad foot switch, it had bad contacts and was arching, so I replaced that also but now I am a happy Acom200A user.
I just used it in the ARRL contest and the combination Acom2000Aand Acom2000S/Acom2000SW (antenna switch) is just working perfect, 1 dit and you are on a different band and antenna.
I will bring the Amplifier to the next SCCC (Feb. 26th at W6EEN) to show it to the Southern California Contesters.
73 Will, K6NDV

192. [acom-list] Re: Acom2000A update

Hi Will,

I'm using an ACOM2000A also and have some questions regarding the ACOM switch. Perhaps you can help me with a few answers please.

1. Do I need the little electronic box to connect the ACOM switch to the amplifier?

2. What, if you switch the ACOM amplifier off and run the station with the transceiver only.
Can I still use the ACOM antenna switch without rewiring the control cabling then?

3. Is there some means to manually select antennas while the ACOM amp is switched off (red button off)?
Also while using another amplifier, can I still use the ACOM antenna switch and control it manually somehow?

By the way, with my FT-1000D I did not have any problems with spikes. This radio at least does not have the spike problem, you were having with ICOMs. There just one nuisance with the amplifier. I can't run the FT-1000D at 200W even when the ACOM is in STB. It then starts complaining too high drive power and beeps a lot. To run the transceiver at higher than 165 Watts (barfoot) I must shut off the ACOM amp all the way (red button OFF). Else it works fine, nothing to complain.

73 / Klaus (DJ6RX)

Hi Will,

I'm using an ACOM2000A also and have some questions regarding the ACOM switch. Perhaps you can help me with a few answers please.

1. Do I need the little electronic box to connect the ACOM switch to the amplifier?

>>Yes it is controlled by the RS-232 interface from the amplifier.
(at least this is in my case, I know there is a way of controlling it by computer)

2. What, if you switch the ACOM amplifier off and run the station with the transceiver only.
Can I still use the ACOM antenna switch without rewiring the control cabling then?

>>Yes but only by the up and down control switch on the Acom 2000S
(again this is in my case, I don't know if controlled by computer)

3. Is there some means to manually select antennas while the ACOM amp is switched off (red button off)?
Also while using another amplifier, can I still use the ACOM antenna switch and control it manually somehow?

>>Yes, see above

By the way, with my FT-1000D I did not have any problems with spikes. This radio at least does not have the spike problem, you were having with ICOMs. There just one nuisance with the amplifier. I can't run the FT-1000D at 200W even when the ACOM is in STB. It then starts complaining too high drive power
and beeps a lot. To run the transceiver at higher than 165 Watts (barfoot) I must shut off the ACOM amp all the way (red button OFF). Else it works fine, nothing to complain.

It comes with a control head and the 10 position switch. Its well built. The control head has an led display to tell you which antenna your on

>
>
> 2. What, if you switch the ACOM amplifier off and run the station with the

Yes it has an up/down switch on the control head. It also comes with its own NULL modem cable to connect to the amplifier.

>
>
> 3. Is there some means to manually select antennas while the ACOM amp is

Same as 2 above. Obviously you'll need to hook the coax up from the switch common to the other amp.

I manually tuned the amp up on all the bands and selected the appropriate switch postition. Now with a quick dit in cw the amp and switch get on the correct band instantly.

Very cool.

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-21 20:24:45 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 191 Message: 196

Hi Will,

I'm happy that all is working with your new IC-775DSP!
I'd like to know what you said or did that got Icom to
fix your problem. I suspect it has something to do with
the "money" half of the "time and money" you mention! HI HI!

An update on my IC-775DSP/2000A combo:

Someone suggested that I fool with the Drive control on the
775 in an attempt to reduce the spike problem. I tried this
method several times since then, but I apparently wasn't
pushing the 775's duty cycle enough to cause trouble,
regardless of the Drive setting.

The ARRL DX Contest this past weekend was my first opportunity
for a sustained, all-out push on the 775. Where I had previously
set the Drive at about the 12:00 position, I found the 10:00 position
to be about the right setting. Any lower setting would reduce the
output so much that I couldn't drive the Acom to full power on 10m.
Any higher setting would kick out the Acom with ARC FAULT
violations. The higher I had the Drive control, the worse the problem
was.

I ran most of the contest with the Drive at 10:00. The amp kicked
out only a few times and only on 15m during hot runs. Interestingly,
the problem is also worse when the ambient temperature in the shack
gets higher. The shack was about 80 deg F during the most troublesome
times.

Also, the output of the 775 varies greatly from band to band at this
"optimum compromise" setting of the Drive. If I'm driving the Acom
to full power on 10m and QSY to 15m, I'm suddenly over-driving the
Acom. I had to be careful to pull back on the 775's RF Output to
prevent transmitting a 2.4KW signal!

I'm still not happy with the 775's situation, but at least I now have a
better understanding of the problem. I have some conclusive evidence
that the 775 is indeed the culprit and I can reproduce the events by
controlling the right variables. I can now go to Icom with empirical
results
instead of subjective intuition and emotionally charged hunches.

Stay tuned my friends!

VY 73 de Glenn K3PP

P.S. I also have an IC-706MkII that I removed from my recently-deceased Toyota pickup truck. I'm tempted to try it on the Acom, but it's probably wise to avoid such a travesty!

197. [acom-list] Amp problem

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-21 20:56:33 UTC
From: Barry Kutner
Topic: 197 Message: 197

Hi gang:
I had an odd problem occur during the contest. I e-mailed Krassy, too. Wonder if anyone else has had this happen:
While on 10 and 15 m, the amp kept trying to retune with every CW character. As this was happening, the amp would mis-detect the frequency. When on 28.030, it indicated 27.750-28.000 (or something close to that - and no CB cracks please). When on 21.005, it would indicate the 21.150-300 segment. Also, the antenna selection jumped around also, between A1 USR and A2 USR.
I turned the amp off Sat. nite before going to sleep, and on Sunday this did not happen again. Of note, we had an ice storm here, which didn't melt off the antennas till Sunday. I was unable to operate 80/160 with more than a few hundred watts due to severe mistuning. The high bands seemed OK, but wonder if that had something to do with it.
Also, this happened on only one amp (I have two).
73,
Barry

Hello Glen, well this is my understanding how to use the drive control.
Turn the PWR down to about 40 watts with the drive control at the normal
full out put setting.
Than start turning the drive control down until you see a slight reduction
of the 40 watts (at mine 775 it is about 9:10) I did not have a single
fault at all. You might have to reset this on different bands.
73 Will

From: David Strout
Topic: 197 Message: 200

Pretty much the same thing at W3MM. We were using his and mine.
Ice screwed everything up including the ACOMs.

By my knowledge ALC is too slow for the "spike".

202. [acom-list] ARRL DX

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-22 03:52:26 UTC
From: Bob Naumann - N5NJ
Topic: 202 Message: 202

We used my Acom at WX0B driving it with an Icom 781. It worked fine
on 40m and on 15m.

The other ops were impressed.

Topic: 191 Message: 203

Thanks Will,

This pretty much correlates to my experience over the weekend.
I did this on 10m, previously one of my worst bands, and 10m
was flawless.

It is aggravating to keep tweaking the controls on band changes,
though. I've gone to great lengths to avoid manual operations
with an expensive automagic amplifier and lots of antenna switching.
I hope to become a serious competitor in the SOA class. Instant,
reliable, and automatic band-changing is a necessity toward this goal.
Control tweaking is contrary to this goal.

I was thinking about using ALC, as Gerry alluded to. You (Will)
say the ALC will be too slow. This is unfortunate. I was hoping
it might be my savior. The engineer in me still says there's a solution
possible using some kind of ALC-like feedback circuit.

I might try drumming up a good sampling oscilloscope at my office
and capture some undeniable evidence of these spikes to fire off to
Icom. I'm angry that Icom continues to deny the existence of a
widespread problem with the 775. This whole experience has really
soured me on Icom gear. It's too bad, too. Otherwise my 775 is
an extremely FB radio!

I'm not surprised that a lower-end rig like the 706 has such a problem,
but the 775 is top-of-the-line, spare-no-expense, competition-grade.
That's why I paid so much for it. I should have paid the lower price tag
for a Yaesu FT-1000MP. Bang-for-the-buck, it's probably the BEST
transceiver available.

I have to believe the same pattern has existed for a long time with
the Alpha 87A also. I know K3II went through hell with his early
generation 775 and his 87A. I'd like to hear more stories from both
the 87A and Acom 2000A camps.

204. [acom-list] Re: Acom2000A update

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-22 15:48:12 UTC
From: Gerald Smith
Topic: 191 Message: 204

The combination of a 781 and a IC4KL does not have a kick off problem, although the 781 is known to have a spike. I think it is reasonable to assume the combination of a 775 and a IC4KL would not exhibit a problem. The IC4KL does have a monitoring facility and will kick off.

When using the IC4KL with an Icom radio, there is an ALC line. In the case of the 781, one turn up the RF output control fully. The limiting of power is done by the ALC line.

No knowing the Acom, one would hope the same kind of behavior is possible with the Icom/Acom combination.

Gerry, W6TER
(Possible buyer of an Acom)

205. [acom-list] Re: Acom2000A update

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-23 04:06:27 UTC
From: Turkisher Dan-CSLC82
Topic: 191 Message: 205

Glenn:

What kinds of antennas have been used when you've had to do all the
tweaking? Are baluns involved? Ferrite? RF chokes? What kind of feedlines?
What other devices are in the line (tuners, antenna switches)?

Do the problems occur when working into a dummy load?

206. [acom-list] External Fan

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-23 14:48:48 UTC
From: k6ndv@contesting.com
Topic: 206 Message: 206

I have tried to get a hold of Krassy in the past week but so far no answer.
The reason for this is: I received the external fan a few weeks ago and I am about ready to install it. It is the fan what Acom supply's and I wonder or it turns on/off automatically as the temp. goes up/down, or do I have to put a switch in line, like the 91B?
Also is there any special installation instructions?
Thanks Will, K6NDV

207. [acom-list] Re: External Fan

Yahoo group: acom-list (1999 — 2009)

Topic: 206 Message: 207

There is a data sheet on installation...I think it was circulated in the email (see Deja News). If you cvan't find one I can send you a copy. The install involves removing the transformer and bolting on the fan/filter, and soldering two leads to the control board by the fan opening. Once installed the fan only comes on if heat sensors dictacte it...no user intervention required.

Will,
I don't have the answer about the fan, just wanted to know
if you will be removing the cover of the ACOM at Don's place so
we can view internal construction?

Hello Dennis, here is the msg. I send out:

The SCCC meeting will be held at the QTH of Don, W6EEN on Feb. 26th.
Bob Cox, K3EST will be the guest of honor.
Ray Novak from Icom America is coming over to let us play with the new Icom
756PRO and he can answer any question you have about this new radio.
I will bring my new Acom2000A amplifier to show and we can open it up so you
can have a peek under the hood.
Meeting time will be around 11:00am.
Please give Don a call or send him an email if you are planning to attend so
he can make a count for lunch.

I know that seeing it in real life is a whole lot better, but there
are some good photos on the Acom web page (along with all sorts of
other good stuff).

212. [acom-list] BIAS TOO LOW AT POWER ON: 000V

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-24 21:32:08 UTC
From: Klaus Heintzenberg
Topic: 212 Message: 212

Today my ACOM2000A gave up after a running time of 236 hrs.
During startup cycle, at second 139 it stops with error
message: BIAS TOO LOW AT POWER ON: 000V.
With 0 success I went thru OFF5 and CCC and the amp still can
not be started. Guess I have to carry it to the local dealer.
Has anybody any experience with such malfunction?
73, Klaus (DJ6RX)

Klaus. Open the amplifier up, and check all connections from the Power supply boards near the transformer. I remember when testing 2000A's (we test every one that goes to a customer from here) that I have once accidentally pulled out a connector when installing the transformer. I also had a fault report on switch-on after doing that. It's worth checking that out.

Hi Will ,
This fan will turns on/off automatically as the temp. goes up/down. You only have to connect the 2 conductors to the board. Make sure that you connect red conductor to +. on the board.

Tough luck Klaus!
Sorry to hear about your amp malfunction!
Hopefully you'll get it fixed quickly. Mine has
worked fine over a year now and I truly hope
that it will continue to run well!
Wish you good luck!

216. [acom-list] Re: Properly doing ALC

Yahoo group: acom-list (1999 — 2009)
Date: 2000-02-28 22:35:18 UTC
From: AA1ND@aol.com
Topic: 216 Message: 216

Hi Glen,

Using ALC feedback from the amplifier to the transceiver, in order to limit the PEP drive, sometimes results in a potentially unstable system, which may tend to generate relaxations. This depends on the resulting loop gain and timing parameters, that is why a careful adjustment is needed to make it useful.

Anyway, as you decided to use the ALC system, here are the amplifier's ALC output electrical specifications of ACOM2000A :

- maximum output voltage (negative to ground) up to -11V;
- output resistance about 500 Ohms;
- maximum output current up to -10mA (self-protected).

The ALC signal is grid-current derived. When the control grid (G1) current changes between zero and 5mA (both tubes summary), the ALC voltage is zero. When this threshold is exceeded, a negative voltage appears on the ALC output, which is proportional to the amount of grid current above the 5mA threshold. Its maximum value (-11V) is reached around 15mA grid current, and can be reduced to zero via the ALC regulator. The regulator is located on the rear panel, just above the ALC connector. Clockwise rotation will increase the maximum ALC voltage, and the loop gain of the system "amplifier + transceiver".

What I could suggest is to reduce the maximum voltage generated by ACOM2000A, in order not to exceed the maximum permissible voltage for your transceiver.For this purpose connect a voltmeter to the ALC output and enter the MEASURE submenu "I-GRID". Increase drive power until you reach 17-18mA grid current. Do not exceed 20mA as a protection would trip there. At this point you will have the maximum ALC output voltage from ACOM2000A, so reduce it until it becomes safe for your transceiver's ALC input (check in your transceiver's operating manual for the proper voltage value).

After having a safe ALC voltage, connect it to the transceiver's ALC input. Then try to adjust it in order to yeld a good regulated "amplifier + transceiver" system, but using ONLY LESS positions of the ACOM2000A ALC output regulator.

73, Vasco, LZ1JK Sofia, February 28, 2000.

217. [acom-list] Protection values - ACOM2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2000-03-07 00:31:06 UTC
From: AA1ND@aol.com
Topic: 217 Message: 217

Hi ,
Here is some information about the protection values for ACOM2000A .

1. DRIVE LED blinks above 80W; trips above 126W. Nominal value is 50...60W for rated output. Reduce drive to overcome the protection.

2(a). FWD-P and RFL-P trip above 203W during standby. Bypassing up to 200W forward and reflected power through the amplifier in STBY and OFF mode is safe. A warning is issued in STBY at 203W threshold to secure amplifier's bypass circuitry safety. With 200W-transceivers you may overcome an eventual warning by reducing the power of about 5-10% or so, when the 203 watt threshold is exceeded accidentally.

Please note, that switching off the amplifier does not resolve the problem, as the amp. only could not tell you that the power is too high for it's bypassing relay, and a risk of damage still exists with more than 200W. If you need more power with the amp. off, you should reconnect the input and output cables leading to the amplifier in order to take it out of any transmitting path for more than 200W.

2(b). RFL-P trips above 502W during operate. Typically a no-load condition or misselected antenna after a band change is the cause.

3. IP LED: blinks above 1.4A plate current; time-lagged trip at 1,6A for 4 seconds; instanteous trip above 2.4A . Reduce drive to overcome it.

Nominal current is 0,95...1,25A, and may vary slightly depending on mains voltage, band, and tuning quality. Idling current is set in the factory to 50mA / 375mA (when keyed with no RF / small RF applied), for minimum IMD.

4. IG2: nominal value of the screen grid current is 60...80mA, but it widely varies with mains, tuning quality, and different tubes. A range of 0...100mA is acceptable. Protected by hardware at 120mA, and by software at 200mA for 20ms time lagged. Reduce drive to overcome it.

5. IG1: nominal control grid current is 5...10mA, trips at 20mA for 20ms time lagged. Reduce drive to overcome it.

The ALC signal is grid-current derived. When the control grid (G1) current appears during transmission between zero and 5mA (both tubes summary), the ALC voltage is zero. When this threshold is exceeded, a negative voltage appears on the ALC output, which is linearily proportional to the amount of grid current above the 5mA threshold. Its maximum value (-11V) is reached around 15mA grid current, and can be continuously reduced to zero via the ALC regulator. The regulator is located on the rear panel, just above the ALC connector. Clockwise rotation will increase the maximum ALC voltage (and the loop gain of the system "amplifier + transceiver"). Using this

output is normaly not needed with modern transceivers.

The electrical parameters of the ALC output are as follows:
- maximum output voltage (negative to ground) up to -11V;
- output resistance about 500 Ohms;
- maximum output current up to -10mA (self-protected).

6. Concerning the "HEATER" LED indicator you may need the following information:

If "HEATER" indicator lits continuously, probably mains voltage is lower than the nominal; if it often blinks, mains voltage is higher. You may still work safely even when "HEATER" is lit, as this is a warning indication only, but the protection threshold is yet close. If even more severe mains voltage deviation occures, the auto protection would trip, the red "PROT" LED will flash, and an appropriate text message will be issued on the LCD.

In order to determine how close are the trip conditions, you may enter the MEASURE sub-menu and monitor the following values:

- MAINS (line input voltage, no protection is directly derived);
- FIL-V (filament voltage, 10V to 14.4V is acceptable);
- IF-REAR (filament current - rear tube, 3A to 4.4A is acceptable);
- IF-FRONT (filament current - front tube, 3A to 4.4A is acceptable);

The heater voltage protection would trip at voltages below 10V or over 14.4V, and the corresponding message to the operator is issued on the RCU. Respectively, the thresholds for heater current protection are 3A and 4.4A, and appropriate messages appear when tripped.

For your information, the nominal filament voltage is 12.6V, and the nominal current is 3.6A. The "HEATER" indicator on the RCU is normally dark. It will constantly light if the filament voltage drops below 11.6V, and it will frequently blink if the voltage exceeds 13.6V (in order to inform you that nearly half of the acceptable range is crossed). In both cases the voltage selection may need to be changed if this conditions predominate. See also p.11 below.

7. Exhaust air Temperature. The optional external fan (when mounted) is accelerated at 90deg.C., and is slowed after the exaust air temperature drops below 80deg.C. Full temperature scale on the RCU (up to 130deg.C., 10 degrees per bar) is acceptable. A ">" sign appears when the scale is overflowed, and a protection trips at 150deg.C threshold.

If the temperature is higher than 80deg.C. at the moment you switch the amplifier off, the tubes are instantly powered off, but the blower would continue cooling, until the exhaust air temperature drops below 80deg.C.

Another protection system monitors the air motion in the tube deck volume. This would prevent the control system of being let down, while measuring a low-temperature but still-standing air above hot tubes. You may get a "LOW AIRFLOW" message in such conditions. Check whether the inlet / outlet

cutouts of the amplifier chassis are not accidentally covered by alien subjects, and let the tubes cool. Clean or replace the air filter. Add the optional external fan in severe temperature conditions, and for continuous modes of operation.

8. DC supply voltages:

template --- "nominal: +/- tollerance% (protection thresholds)";

+5V: +10/-15% (4.25...5.5)V; logic and analogue circuits voltage.

+/-12V: +15/-15% (10...14)V; analogue and RS232-port voltage.

+24V: +27/-30% (17...30.5)V; power-on relays voltage.

+48V: +27/-30% (34...61)V; antenna and input relays voltage.

+12/340V controlled screen grid voltage. Typically 10...15V during standby (EG2 is off), and 320...350V during operate (EG2 is on). Protection thresholds: more than 40V during standby; less than 150V or more than 430V during operate.

+2850V plate voltage (no load condition): +15/-55% (1280...3300)V; 2300...2500V is nominal at various loads and mains internal resistance for rated output.
-124/-75/-52V controlled bias voltage. Typically -115...-130V during standby / -70...-80V during operate idling / -45...-60V during operate with RF applied. Adjusted in the factory during setting of plate idling currents for minimum IMD (see p.3 above). Protection thresholds: less than -100V during STBY, and less than -35V during OPERATE.

9. The following measurands are calculated on the base of directly measured parameters:
- DC INPUT is calculated from (HV x IP); no protections from DC INPUTare derived.
- GAIN is calculated from (FWD_P / DRIVE); a "LOW GAIN" protection is derived at a threshold below 10dB gain.
- VSWR is calculated from Gm=(RFL_P/FWD_P); VSWR = (1 + Gm) / (1 - Gm); no protections derived.

The used above HV, IP, DRIVE, FWD-P, RFL-P, the 12 remaining measurands listed in S.4-3, p.19 of the Operating Manual, and also 4 supply voltages are directly measured via the analog-to digital converter in the CPU PCB. Multiple protections and tuning criteria are based on this information.

10. In addition of the above listed, a variety of values are checked dynamically while the amplifier's status is being changed, thus more protections may trip if bad conditions are detected. For instance, the heater current peak, HV, and EG2 are differently controlled during the power-on period, or while changing from standby to operate and vice versa. Also, the input and output relays contact time performance is verified at every dot/dash keying, and RF appearance.

11. Mains voltage tollerances.

See S.7-1j on p.29 of the Operating Manual. Normally, a +/-10% excursion of nominal tap voltage is acceptable. For instance, this is 216...264V with 240V nominal. The amplifier would work up to +/-15%.

If you however exceed this threshold (below 204V or over 276V for 240V nominal), supply voltages and/or currents may reach dangerous values. No protection is directly associated with the mains voltage, but nearly all supply voltages (and some currents) would reach threshold values, so various amplifier protections would begin tripping, in order not to let any damage in both: power supply, or the tubes.

Anyway, the control circuit is happy even at a voltage drop of-20%, i.e. below 190V, with 240V nominal tap selected. If mains voltage still drops further (below -25%), the control circuit in the RCU immediately switches off the amplifier, and becomes inoperative until the voltage restores to at least -15...20% of nominal, i.e. at least 190...200V, with 240V nominal. This hysteresis is intended to reject unusable RCU restartings if the voltage is continuously fluctuating near the lower limit.

A controllable step-up / step-down tap-transformer (for 20A nominal current) would be a good solution in such conditions, not only for the amplifier. You may find also suitable automatic AC voltage regulators on the market.

12. An additional possibility is foreseen in order to partly compensate for any mains voltage deviation not to affect the tubes plate efficiency. This is the DEF sub-menu in the OFF menu (see also page 22, 5-6a of the Operating Manual). Set the MAINS VOLTAGE menu selection to HIGH, when mains voltage is typically 5% (or more) higher than nominal tap (i.e. higher than 252V with 240V nominal). Set the menu selection to LOW when mains voltage is typically 5% lower than nominal tap (i.e. lower than 228V with 240V nominal). For lower voltages first set lower nominal taps of the transformer (i.e.220V, 200, 120 or 100V), and observe same rules about menu voltage selection. Anyway, a voltage of (230...240)V should be considered to be NORMAL with 240V nominal tap.

Please note, that this menu selection does not change the real supply voltages, but only the plate load resistance to which the AUTO TUNE procedure would match your antennas. With HIGH selection you will request a higher plate resistance, and vice versa, thus merely doing the best at your real conditions.

Best 73! Vasco, LZ1JK , Krassy K1LZ

218. [acom-list] Acom/Kachina Remote

Yahoo group: acom-list (1999 — 2009)
Date: 2000-03-24 16:16:06 UTC
From: Richard Thorne
Topic: 218 Message: 218

Hi Guys:

Just a brief update on my remote controlled station using the Acom 2000a Amp and Kachina 505dsp hf rig.

The Acom requires that pin 1 and 5 be shorted for 1 to 2 seconds to turn the amp on. I just finished an interface circuit that uses one of the 12v signals from the Kachina 505arx rotor control to activite a 12v relay. The contacts of the relay are connected to pin 1 and 5 of the remote connector on the back of the Acom amp. I installed an rca femal jack on the hood of the db9. Inside the hood I connected the rca jack to pin one and five and then used a jumber cable between it and the 505arx.

I can now turn the amp on and off remotely, works great!! No more leaving the amp so I can operate. I can simply turn it on with a software command via the Kachina software.

The next step will be using the remaining 4 12v signals from the 505arx to control my WX0B stack match phasing box. I'll be able to pick any combination of a 3 antenna stack.

Its been a lot of work, but this remote station is about 98% of the station I used to have in my home. In a lot of respects its better.

See ya on the bands.

219. QST Review of Acom 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2000-04-07 16:18:04 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 219 Message: 219

I was just snooping on the ARRL's Members-Only web site (don't tell my boss!), and I spotted a review of the Acom 2000A that will appear in the May issue of QST! I was wondering when we'd finally see a published review in QST or CQ.

It was reviewed and written by none other than Dave Sumner K1ZZ himself. It's a glowing review of the unit, as most of us on this reflector would agree.
I found the review on the page:

http://www.arrl.org/members-only/prodrev/bymfg.html

which is a comprehensive product review listing sorted by manufacturer. You need to be a properly registered ARRL member to access the reviews. The PDF file also includes a review of the Kenwood TM-D700A Dual-Band V/UHF mobile transceiver.

221. Re: ACOM 20000A and FT10000D

Yahoo group: acom-list (1999 — 2009)
Date: 2000-04-23 12:53:41 UTC
From: aa1nd@aol.com
Topic: 221 Message: 221

Hi Henry ,
Somebody smart created this which is totally incorrect but people are happy to create problems and just to talk about it.

1. Bypassing up to 200W forward and reflected power through ACOM2000A in STBY and OFF mode is safe. A warning is issued in STBY at 203 watt threshold to secure amplifier's bypass circuitry safety. Please note that this is not a problem to be fixed as it's a warning message.

You may overcome an eventual warning with a 200W-transceiver by reducing its power to 180-190W or so (if the 203 watt threshold is exceeded accidentally by a peak at the beginning of transmissions).

Since you have a beep-volume regulator on the RCU, you might turn it down to zero. Nevertheless, please note, that even switching off the amplifier, actually would not push aside the caution: the amp. only could not warn you when the power is dangerous for it's bypassing relay, and a risk of damage still exists with more than 200W. By the way, this concerns most other amplifiers, but they do not care about their input bypassing relays...

You should not need to reconnect the input and output cables to take the amp. out of a powerful path (more than 200W). The best solution is to use the amplifier in OPERATE since it could be easily low-driven too (5-10 Watts or so) in order to get 150-300W output only, when full power is superfluous.

2. About the auto-operate function: a PC remote-control application for WINDOWS is being developed by Gerry/W1VE which includes this option. A beta-version is now available, and I expect that he will soon finish the design. Nevertheless, we plan to make a firmware upgrade which would include the auto-operate function too.

Dear Sir:
My name is Paul Pai. and Callsign is BV4FH.
Our BQ9P QSL manager Steve/KU9C and our good friend Henry/KE1AC contact with ACOM before we took off for BQ9P Pratas Island DXpedition on Apr 5-13,2000,
a great news from our friends that we can have two of ACOM 2000A for our DXpedition,
It makes everything wonderful, and put everything together to make a successful operation,
31,000 QSO`s in 7 days.
Also it works very well by generators running 220V, 7 days 24 hours a day.
We appreciated ACOM supported this operation and it will do better job for future BQ9P
DXpedition.
Thanks again, We do appreciated the contribution to world wide Radio society by ACOM.
73

Paul Pai./BV4FH /BQ9P Committee./ DX Committee of Chinese Taipei Amateur Radio League.

Yes! The new ACOM 1000: 1KW continuous, 1.8-54 MHz. Handles 3:1 VSWR. 17 x 14 x7. 40 Lbs. Single 4CX800A. Simplified manual tuning. Continuous monitoring and idiot proof protection sim. to ACOM 2000A. Great DX-pedition rig! 'Hope to try it on six meters during the June VHF contest. 'Should have FCC approval shortly.

Also, two software packages. One to handle remote control and multi antenna switching, the other for running multi-single contest stations. To be available shortly.

At Dayton ACOM had a great, live exhibit showing a multi-single station in operation with rigs/ACOM amps switching between ten antennas (dummy loads!), using the ACOM antenna switchers and the newly developed software. I expect pictures will be on the ACOM website shortly.

73, Henry, KE1AC/TO0DX (Look for us from CY9 and FP in July)

229. Warranty Work

Yahoo group: acom-list (1999 — 2009)
Date: 2000-06-09 14:33:58 UTC
From: Richard Thorne
Topic: 229 Message: 229

Hi Guys:

Just a quick note to praise Acom on warranty work. I had a small problem which required the amp to go back to Krassy, in MA.

He had it repaired the same day it was received. How about that for turn around time.

I sure am glad I have the Acom and Kachina combination. The service with both companies is outstanding.

230. [acom-list] Heater voltage

Yahoo group: acom-list (1999 — 2009)
Date: 2000-06-20 14:10:39 UTC
From: Anders Larsson
Topic: 230 Message: 230

Just took delivery of my ACOM2000A.... What a master piece!

The dealer said that when putting in the transformer he set the primary voltage to 230v! I read in the manual that there are taps for 220V and 240V. In the Manual 240V is entered on page 6.

The Mains voltage as displayed in the Measure sub-menu reads between 233 and 236V and the Heater voltage varies between 13.3 and 13.4V. The HEATER LED sometimes flicker a little. This applies under no-load conditions. Under load conditions the Mains drops below 230V.

I do not feel comfortable with that high heater voltage. Do I need to reset the primary to 240V? Directions appreciated.

I run mine on 240, and the line voltage is 235 no load and sometimes drops
to about 228. It works just fine that way, and has been FOR 2 YEARS NOW.

232. software

Yahoo group: acom-list (1999 — 2009)
Date: 2000-06-22 14:33:05 UTC
From: Barry Kutner
Topic: 232 Message: 232

Hi all,
I found this on the hfpower.com Web site, and thought it would be of
interest.
73,
Barry

My long-awaited control software for the Acom 2000 and 2000SW will
be available for download July 1, from my website at
{HYPERLINK "http://www.inetmarket.com/hamtools"}http://www.inetmarket.com/hamtools. You
can see the current feature
list at that site.
You can address specific questions not currently covered on the web
page by emailing me directly at hamtools@....
The software will be free of charge to Acom International customers.
You will need to provide your amplifier or switch serial number.
Again, please direct all questions about the software to myself and not to
Krassy.
73,
Gerry, W1VE Hull Computer Consulting

Thanks Barry, for the update.

I'm really looking forward to the software here. I understand, and could be wrong, that the package will control the
amp as well as the 2000s switch. Perfect for my remote operation.

234. Error Message

Yahoo group: acom-list (1999 — 2009)
Date: 2000-06-28 18:49:03 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 234 Message: 234

I haven't played radio in quite a while. I went into the shack the other day to skim the bands and my Acom 2000A didn't fire up properly. After warmup, I went to switch it out of standby and it turned off with the following message:

G2 VOLTAGE
TOO LOW: 158V

Following the OFF5 procedure and the other suggestion (I don't remember it off the top of my head), still had the same results. I suspect this is the
voltage going to the screen grid and the schematic shows this at approx twice the error value.

I remember others on this list having problems that were fixed simply by re-plugging a connector rom the power transformer. Is the likely issue with mine? I plan to open it up and try it in the next few days.

Any words of wisdom from the brilliant masters on this list?

It sounds just like what happened with mine.

Check each pin in the Molex connectors by pushing the individual wires
together with two pairs of needle-nose pliers.

You'll probably find one that is not exactly snug.

My guess is that the tolerances are off a little allowing the pins and
sockets to be less than firmly pushed together even though the plastic
housing appears to be.

Hi,

I just got my new ACOM 2000A on the air last night -- (SN 000116)
The automatic switch should arrive soon.

Looks Great, Works Great!!

It is a perfect match with my FT1000MP Mark V !!

I really treated myself for my 60th birthday on June 24th ---

Congrats, Bill! I'm sure the reflector would like to hear more about your experiences with that combination. Are you running the Mark V in it's full-power mode with the RF output turned down, or have you switched to the 'super-linear' mode with the max output at 75W? That mode sounds like a great chouice if you run the amp most of the time.

Jim K1IR

Your going to love the amp/switch combo. Once you set the amp up its
neat to see the switch choose the correct antenna.

Hi Folks:

I?m using my two ACOM 2000 for more than a year and they are working perfectly.
I?m not using the switch yet, but I intend to do it.
I will need to have a longer cable to install the switch on the Tower.
Somebody in the list is doing that?
Regards

Oms PY5EG

A transceiver in super linear mode together with a super linear amp will create a new problem: your neighboring hams on the next channel will come closer to your frequency and splatter over you because they simply do not know you are there! You get more QRM!

Another important question: when you crank down your power level: will you still have same relation beetween pep and sideband noise/spuriouses as when you run your rig with full output power?

243. Jim de Bill, K5YG (Mark V with 2000A)

Yahoo group: acom-list (1999 — 2009)
Date: 2000-06-30 00:13:12 UTC
From: k5yg@aol.com
Topic: 243 Message: 243

In a message dated 00-06-29 08:57:49 EDT, you write:

<< Are you running the Mark V in it's
full-power mode with the RF output turned down, or have you switched to the
'super-linear' mode with the max output at 75W? That mode sounds like a
great
chouice if you run the amp most of the time. >>

Hi Jim,

Thus far I have only had a couple contacts with the Mark V and 2000A -- With excellent reports - My first contact was with the RF turned down - I then switched to class A with the power out around 50W. I will probably run in in the "super-linear" mode --

We can have a sked on any band you wish if you would like to hear how it sounds in various modes - let me know -- I will be off work for the next 5 days - so any day is ok - let me know --

73, Bill

Here is a copy of what I sent to someone else on first impressions:

I had the FT1000MP and a Omni-6 Plus prior to the Mark V -- I sold the FT1000MP to a friend and kept the Ten-Tec Omni-6 Plus. I will use the Omni-6 for RTTY and back up for the Mark V.

I have less than 20 contacts using the Mark V -- I like it very much - I am happy that I purchased it.

I have not had time to install optional filters 250hz and 500hz filters. The unit works great right out of the box with the 2.4khz filters in the 2nd and 3rd IFs. (The 2.4 khz in the 455Kz IF is a new 10 pole Collins Mechancial Filter), and a 500Hz Crystal Filter in the 2nd IF. The unit works so will with the 2.4khz filters, I decided not to buy the 2.4khz NRAD or Yaesu filters. The unit works very well on CW just with the one 500Hz filter installed.

I feel that the sensitivity is better with the Mark V --- and like the DSP controls on the front panel.

I get excellent audio reports using my Heil HC5 Microphone element.

Hello to the all friends,

I have got my Acom 2000A SN 000131 some days ago
and doing first QSOs and tests.

Had an Alpha 87a before and do like now the auto-
tuning of the Acom which makes live with different
SWRs much more comfortable. The RF-relay is a bit
to hear, but because of the rubber-isolation from
chassis not disturbing. Also the transformer does
give some hum onto the chassis, may be this is a
50 to 60 hz problem here in Europe, but the hum is
lower than the airflow - so no problem.

Tested also the PW-1 from Icom, that one gave me the
feeling of beeing in an 747 Jumbo at 800KM/h when doing
RTTY and all 6 Fans running.

First of all, I have not got TVI-calls from the
neighbours - vy happy about that, did pull some
ferrit-cores over all to the amp connected cables
to supress stray-rf in the shack an to the mains.

The output goes through an coax-lightning-arrestor
out of the shack. Had some Trips and was a long time
searching for, the fault came from the to low fuse
inside, I had to replace to a 600V (for 2KW).

I have about 10 degrees C difference between the tubes
when running RTTY for about 5-6 Minutes with 400 Watts
there is 110 / 120 degrees indicated on the RCU.
As the Acom has a save-level at 130 degrees and protection
at 150 degrees as I saw on Vascos LZ1JK very interesting
informations here on this NewsBoard. I think one should not
use more than 500 Watts continous-output for more than
5 minutes to get it not too hot, or does any of the readers
here have an additional FAN on the Backside and does this
one give longer transmission-times or more output with
acceptable temperatures on the tubes ?

Some may have longer experience now and give some additional
comments ?

Had the Alpha-Remote-Software in use and hope the users here
in Europe can also get the new announced Windows-Software for
the ACOM 2000A next week ?

73 and best regards to all
Helmut oe9eri

Hello Helmut: Congrats on the amp. I run RTTY, and I do have the optional fan installed behind the transformer. My tube temps have NEVER been higher than 70 C, and this is running 1500W RTTY all weekend in CQ WW RTTY contest! Perhaps Krassy or Vasco can comment, but I believe those tube temps are too high for 500 W in 5 minutes. Maybe there is a problem with your fan, or your amp is too confined near a wall or shelf and aiflow is restricted?

My observation is the same as Barry's. I just ran a test of 500 watts output on 15 meters for 2 minutes without the additional fan. My temp rose to about 62 degrees.

Could another possible cause of temperature rise be a higher swr? If you are tolerating more than 1.2:1 or 1.5:1, it is possible that more power is being dissipated by the tube and output circuit, generating more heat.

73,

Jim

Hello Barry and Jim,

thank you very much for your comments to my questions.

I do start at the moment the Acom from power-on with 29
degrees at switch-on and now I apply 500W out continous
carrier.
You are right, the Amp is here below the table on the floor because
so it is more quiet near the microphone, the table is not close to the
wall, about 2-3 inches space arround. Front side of table is open and
from the top of the Acom to the table is about 15 inches space.
Doing so reduces the noise from the blower comming to my Goldline-
Mikrophone which needs a bit of amplification.

This is not the best air-flow-position for that heat comming out of
the chimneys, and after 5 Minutes the temp ist 105/115 degrees on the
RCU-Meter.

This position is adequate for SSB, but not for longer RTTY or other
continous-carrier operations.

Normaly the 500W are enough for TTY or Pactor, PSK31 or SSTV and I
will try an additional fan at the backside for a cooler operation,
but still will try to keep the Amp down under the table.

So this is not a serious problem, and as Barry said, when there is the
fan on the backside and the Amp is on top of the table, there ist a
1500W carrier possible for a longer time !

Looking foreward for maybe some more comments

73 Helmut oe9eri

By the way, I measured the EFFICIENCY of the amplifier at 500 watts and at 1500 watts output. These readings were taken from the RCU. At 1.27kW output, input power was 2.35kW, and efficiency is 54%. The power NOT going to the antenna is about 1.1kW. At 500W output, input power was 1.65kW and efficiency is 30%. The power dissipated as heat is still about 1.1kW. Did I calculate all this correctly, guys?

Jim

Jim,
Actually, overall efficiency at 500 W out is even less than you
calculate. There is also the power used by the filaments which is
fixed regardless of power output. I don't recall the numbers, but
believe it's about 100 W per tube. So if you include that power as
part of your input power, it has a bigger impact at 500 W out.
BTW, Jim, whatever happened to the service manual, which about
a year ago was supposed to be in the process of being translated
into English?

250. Re: New User

Yahoo group: acom-list (1999 — 2009)
Date: 2000-07-01 08:25:25 UTC
From: oe9eri@yahoo.de
Topic: 248 Message: 250

Hello again,

while you are sleeping I made another test regarding the
efficiency-calculations from Jim.

Since the seventees I was running an L-4B, and from manual-tuning
I know that tuning for 500W RTTY and 1 KW SSB was different and
had to retune when going from 500 up to 1 KW to get the Load
tuned for maximum Output at 1 KW and retune also the Plate a bit.

With the Acom, Autotune uses only about 400-500W Output and tunes
very sophisticated - the output is then variable up to 2000 W so
the load is optimum for the highest output !

At 500W the Autotune is not so accurate, because when I tune the
Acom manually at 500W, I can change the efficiency from about 30%
up to 40%.
Between the 30 and 40% the temperature-difference on my 5 Minute-test
is about - 10 degrees for the 40% efficiency at 500W output.

We have to think also, as Barry wrote, to the 50W per Tube Heating
but that one is in every case present.

One of the questions was my 10 degrees difference between the
rear and front Tube, but I think this will be normal ? Its not
at Stby-Temperatures, those are equal, only at higher temperatures
there comes the difference.

73, Helmut oe9eri

251. Help! G2 VOLTAGE TOO LOW: 158V

Yahoo group: acom-list (1999 — 2009)
Date: 2000-07-01 21:52:05 UTC
From: O Donnell, Glenn D (Glenn)
Topic: 251 Message: 251

I posted a few days ago that I was getting this error message.
I finally got a chance to open the unit today. I re-seated the
connectors on the HV Supply board and took some voltage
measurements. The problem is still there. Here are some
observations:

The 310VAC on connector JP2 is fine. The 340VDC on JP7
is dead. I get ZERO. Without the schematic for the HV Supply,
I can do little beyond this. I may take the board out and attempt
to reverse engineer the schematic, but I thought I'd try here first.
The bridge rectifier and filter capacitors are working, as I have
proper output from here. After this point, it gets a bit fuzzy.

There is a three-pin device that looks like a power transistor
or a voltage regulator, attached to the front of the chassis
with a cable from the HV board. It has print on it, but it was
too hard to read with the inadequate lighting. I'll go back with
a better light for another try. The middle pin has about 400VDC
on it and the other two have ZERO. This doesn't seem right to
me. Have I stumbled onto the root cause?

Krassy/Jim: What advice do you have? If you send me the
schematic of the HV board, I can take more measurements
and possibly find a bad component. Do I send back the board?
Do you send me one? Do you send me one of these three-pin
devices? Am I barking up the wrong tree? Is it just cockpit
error? I doubt it, but anything is possible. Help!

I NEED THIS WORKING FOR THE IARU CONTEST!! I can
finally enter competitively with big power, but now I'm dead
in the water. IARU has no low power category. Fooey!

Thanks all ES 73!
de Glenn K3PP

HI John,

Really wished for 87A but I guess the extra few hundred bucks for the ALPHA
and the replacement tube cost differences drove me to ACOM.

Also expected lots of high SWR trips from ALPHA based upon experience
with borrowed ALPHA89 here. Operate all bands and modes here.
Keeping SWR down everywhere on all antennas has proved to be too
difficult to accomplish here.

Hi Brian

tks for your response.

I have found the Alpha "auto tune" a little missleading.

I did get the auto tune auto match -
whatever the name of the $100 kit is, but
in talking to Alpha folks on the phone, I gather that it really doesn't kick
in
until the rig is into the 1 kw range.

If my SWR is off at 100 watts it will be even more so at 1 kw!

My problems seem to be I like to roam all over all bands and all modes,
with multiband wire antennas and ant tuners;
the Alpha just doesn't care for that --

When I do a big QSY, I need to go back to vy low power and tune the AT,
then continue to bring up the power and adj the AT,
then kick in the Alpha.

(I know you were looking for ACom comments - sorry I'm only on the list
to rec comments --
maybe my experience will make you happy with your ACOM!)

Brian,

There's nothing to be concerned with on the Acom.

That's the beauty of it. It's so well protected that you can't hurt it. Even if you were to blow the tubes, a replacement pair is only about $200. I bought a pair just in case from the guy in Florida.

Sorry to report a bad experience:
After 100 QSO?s the antenna relay got stuck... Tapping it releases it but
after a few operations it sticks again. No spare part available in Germany
and the dealers technician is going on leave. Will have to wait..
Otherwise I am impressed with it especially the very low noise fan.

271. How to (multiple ants/band)?

Yahoo group: acom-list (1999 — 2009)
Date: 2000-09-07 19:11:03 UTC
From: alsopb
Topic: 271 Message: 271

Guys,

I have my own automated antenna switching system. I try to have two antennas/band
available. Which one to use at a particular time is determined by flipping a switch. I need to tell the ACOM amp that I am using antenna #x now and then have it select the proper tune info from its memory when it goes to xmit. Something like a simple off-on or BCD signal to the ACOM. This would be the preferred route.

Alternatively, I could select the antenna # from the ACOM and tell my switching circuit to change if it could only output a suitable signal. I don't like this because most likely I'd always be on the wrong menu. It would probably not activate the antenna while in the receive mode anyhow. Receive mode is how which antenna to use is determined.

I am not interested in doing this the hard way (via computer hookup to the ACOM).
I already have my computer fully occupied with other station controls and logging.
I don't need another keyboard on the desk!

The first route would also solve another problem. The band segments appear somewhat wider than desired on certain bands. It would be desirable to break up the band segment (via such a signal) into a CW "antenna" , RTTY "antenna" and SSB "antenna" via similar input and assure best tune for each.

Any ideas?

73 de Brian/K3KO

273. Alpha closing down!

Yahoo group: acom-list (1999 — 2009)
Date: 2000-09-08 19:25:36 UTC
From: Barry Kutner
Topic: 273 Message: 273

I thought this would interest Acom enthusiasts. The following comes from Alpha's Web page:

A message to all ALPHA customers, fans and friends...

As you know, we sold Ehrhorn Technological Operations, Inc. several years ago. I subsequently repurchased the ALPHA amateur radio amplifier line that long had been ETO□s raison d□être, and incorporated it as Alpha/Power, Inc. Although I had devoted 25 years to ETO/ALPHA and wanted to pursue other interests long postponed, I also strongly wanted the ALPHA tradition to be carried on.

Fortunately, almost three years ago I was able to persuade John Brosnahan, W0UN, to become president and technical director of Alpha/Power. Under John□s leadership, Alpha/Power□s worldwide reputation for delivering the most advanced and finest HF power amplifiers and customer service in amateur radio has been enhanced even more. But a combination of health issues and family obligations now makes it impossible for John to continue devoting all or most of his time to ALPHA operations.

We□ve had a great run of more than three decades "on top" ... I□m not willing to risk that ALPHA legacy. Nor am I aware of any person or entity with the desire, the proven ability, the commitment, and the resources to acquire ALPHA and perpetuate the standards to which we□ve been dedicated for thirty-one years. In the event such interest does exist, however, we remain open to serious discussions. In the meantime...

When the current run of ALPHA 87A and ALPHA 99 amplifiers is completed, we will terminate engineering and manufacturing operations.

Warranty and post-warranty service will continue to be available
at ALPHA/POWER in Longmont, Colorado - at its current street
and e-mail addresses, phone and FAX numbers. Every warranty
will be honored in full. And, of course, this final batch of new
amplifiers will carry ALPHA□s standard 4-year, non-prorated
limited warranty.

Jiim,

Can only speak from my own experience. I am very pleased. I had one problem early on. When I called Krassy he sent me a new amp before I even sent mine back. There have been some reports of low grid voltage which has been attributed to a loose connection. The current amp has operated flawlessly for better than a year. I do recommend it

Subject: Acom

Howard, Do you still like the Acom?? I am thinking of getting one. Torn between an Alpha 87A ((Alpha making last run before closing production))) or the Acom ((Made overseas)).

Noticed a Ham in Florida had purchased two Acom's.....was telling everyone how he liked them but understand he has sold both?????

Any insight would be appreciated.

Been playing with the ACOM amp for the past few days (20 hours
already...)

Wow. A 1.5Kw xcvr. Coupled with automatic antenna switching, there
are no
switches to throw or knobs to turn to switch bands.

The old Signal-one idea of a KW xcvr finally got respect.

I find the power off menu nearly impossible to see in my room. Need
flash-light to view it. Any way providing at least some back-lighting
to it?

I still am a desktop man. The amp is mounted on the desk. Had no
place for the RCU.
It turns out you can "mount" it on the front panel by making up one
clip. Extend the bale out at right angles to the RCU. Find one of
the screws in the second row (of the cabinet top) close to where you
want the unit to go and fabricate a clip from some scrap metal. The
clip goes over the bale. I used metal from an old PC slot cover to do
the trick. No holes and the feet of the RCU protect the front panel.

Here is an unadvertised benefit of the ACOM.

It is sitting next to my monitor on the operating desk. The XYL uses the computer, which is integral to the station.

She used the computer off and on for 4 days before even noticing the ACOM. I hope her thinking is that it is black, has no meters and no knobs and thus MUST be less expensive than the amp it replaced.

Tonight she saw it only because the RCU was lit up.

This amp has not yet caused me any problems (electrical or domestic)

Ah yes Brian, The ACOM is a thing of beauty sitting on the operating desk. It is natural for XYL's to think "hmmm, this must not have cost much - the front is not cluttered with thing a ma jigs, doo hitchies, buttons, and knobs."

When my XYL saw the ACOM for the first time she asked" Is that new, what is it?" I replied it replaces the amplifer I sold. "Oh" she replied, "This is much nicer looking." Not a word more was said, nor did she ask how much it cost.

Hi,

My Acom cost me 10K ! - My wife knew what it cost and kindly requested 5K
for some "pretty stuff" she wanted! Now she can't wait for me to buy some
more toys.

In any case the amp is well worth the 10K --- hi --

My XYL usually does the same thing to me. She finds out how much I've spent, and figures that she should be able to spend the same amount. This goes on all the time.

I'm hiding my Acom at another ham's house (I'm not kidding) until I'm sure she can't figure out how much I spent, or I have enough money in the bank to cover her purchase.

I just wish she'd buy another Acom as it'd be nice to have one on each radio !

I get my stuff shipped to the office, and bring it home when XYL is
out. XYL rarely comes down to the shack, but the kids notice
EVERYTHING, even if I move a piece of paper!

Like you, Barry, I have my stuff shipped to the office. Then I bring it in through the back door and install it after Letterman. I can usually count on the new item not being noticed for at least a day or two. Then all I have to say is, "Oh, that? You never saw it before? It's been there for a looooong time."

Large antenna-related items are the most difficult purchases to deal with. Since they usually come in UPS-shippable packaging, the receiving problem is manageable. But, there are definite problems trying to put the new antenna together and install it after Letterman . . .

Good idea but it won't work for me. We both work in the same office and she gets the shipping tickets.

I'm definitely doing this all wrong. On the other hand I do have an amp......So maybe I just have a great wife, HI.

But it goes back to the other example. If spend it she gets to too.

Best email thread I've followed in a LONG time! :-)

I guess I'll be a braggart too. My XYL actually paid for my Acom
as a birthday present last year. In fact, ALL of my radio toys,
including the transceivers, tower, antennas, etc. are courtesy
of my XYL. I got it good and I know it, so I ain't gonna mess
with a good thing!

She did say, upon first seeing the amp, "I paid five grand
for THAT?!" It is, indeed a stealth toy! I told her she paid
by the pound and then challenged her to pick it up! :-)

Bill,

I like the switch. I decided to use it inside the shack instead of putting it out on the tower. That way, when I run single-op, everything is fully automated. When I want to reconfigure the station for a multi, all the cables for individual antennas are already coming into the shack. The added benefit is that the switch isn't exposed to any weather.

Jim

Love the switch. I replaced my Ameritron with it. The only thing that will make it real nice is the new software that is coming.

Great combination.

I know you are all impatiently waiting and waiting
and waiting for the release.

I want to use it in CQWW as much as you all do!

I am putting final touches on the installer, and
cleaning up the user interface a bit. It should
be ready very soon -- I hope by this weekend.

The software will support both the 2000A and the
2000SW Switch. It will install directly from an
internet download. It will have an initial 90-day
free trial period, and it will be 100% operational.
After that, you need to license the program. if you
bought your switch/amp in the USA, the license is free.
To all others, there will be a $35 fee.

I'll try and give you daily updates on the release
progress on this reflector. I am working hard to make
it this week. -- I'd like you all to have it for the
RTTY contest.

73 and hang in there...

-Gerry, W1VE

From: Gerry Hull
Topic: 298 Message: 298

Hello Friends,

I am very close to making the software available. I missed my goal
of today -- too bad, wanted to make some Qs in the RTTY contest, but
going to continue with finishing up. We are day or two away.

73,

-Gerry, W1VE

Hi Gerry,

I can't wait to get your software - I would like to find out why I am getting "Detected RF Power at Wrong Time" faults and "Auto Protection Drive Power Removed" faults when operating RTTY. Drive level is 43 watts for 1KW out on 20M. It appears to occur more often when using AFSK and VOX, but did occur last night using FSK and PTT line keyed via my HAL DXP38.

Krassy, Do you still have your computer hooked up to the phone line to receive the error messages from the ACOM 2000A????

73, Bill

Hi Bill,

Well, the software won't help you with that issue... It reports errors just like the remote, but gives you no further diagnostic other than metering. It sounds like RF is getting into metering or something like that. I'm assuming SWR is fine & the antenna system is far from the shack... Perhaps Krassy can shed some light...

73,

-Gerry

302. A2000 Faults out with "Detected RF Power at wrong time"

Yahoo group: acom-list (1999 — 2009)
Date: 2000-09-23 18:53:56 UTC
From: Bill Musa
Topic: 298 Message: 302

Hi Gerry,

Tnx for info on remote SW not going to tell me anything - thought it couuld read the diagnostics memory.

The VSWR is 1.2:1 feeding a 4-elm monoband yagi.
I have many hours operating at 1500watts out on CW and SSB with the Amp in the exact same postion it is now. I am thinking that maybe using the AFSK to key the VOX circuit may be contributing to the probem, althoght it tripped out once last night using FSK and PTT line. I did notice that at one point when I was operating on 14085 RTTY, that the control unit said 14100-14200 ! Now that is strange! I went back through all band segment settings - all were ok and 14000-14100 was displayed the next time I xmited on 14085. I also re-tuned the AMP on the 14000-14100 band segment. I operated some FSK / PTT line this AM HP and the amp did not trip out with the faults I saw last night - Now I need to try AFSK and VOX again to see what happens. My Omni6 Plus does have a key in / key out line. Maybe I should connect the key out line to the ACOM AMP - maybe I have a race condition with the RF drive reaching the AMP before it thinks it should.

If drive is not removed quick enought when the Detected RF power at wrong time fault occurs the amp is powered all the way off by the "Auto Protection Drive Power Removed" fault.

Hi Rich,

Before I tell you what the software will do, a little history...

I'm Gerry, W1VE/VE1RM, in Greenfield, NH (a YCCC'r). I'm a software developer (consultant) and a friend of Krassy's. When I heard of the '2000, I told Krassy I would like to write some control software for the 2000A and the 2000SW switch. That was last year -- when we started. I started out with great guns -- and with a lot of feedback from the boys in Bulgaria, I got an inital beta done. A few of the guys who have amps were given a beta copy, and it seemed to work pretty well...

Then, I had way to many commitments on the "commerical" side, so I've had no time at all to complete the project... Only in the past few weeks have I had decent time to get back to it....

So, What is the software and what will it do?

First off, the software will run on Windows 95, 98, ME, NT and 2000 -- all flavors! :-)

There are two modules: one for the amplifier and one for the switch.
In the amplifier module:
- You get almost all the functionality of the control unit in a windows application:
- You get remote monitoring of forward and reflected power in real time on "LED" meters...
- standby/operate control.
- Popup warnings when "bad" conditions are happening in the amplifier.
- Metering of all critical values (same as control unit)
- Logic for Powering ON/OFF the amplifier from your computer.
(The amplifier cannot be directly turned ON via software; however, if the front-panel switch is ON, then there are a set of pins on the RS-232 connector, when shorted for one second, start the amp in a power up seqence. I use unused signals in the PC RS-232 line to toggle this. The user will have to build a little relay or saturated-transistor switch.)

- The ability to tune the amplifier to a frequency WITHOUT transmitting.
I have built an PlugIn API (Applications Programming Interface) for my
HamTools application which interfaces with third-party software and
provides current-frequency information. For example, when I ship,
Support for WriteLog and TRX-Manager will be included. I will also
provide a simple Software Development Kit to allow the other popular
programs to be interfaced to my application. The API works like this:
Your running WriteLog (for example) and running on 20 meters. You see
a great spot on 10. When you grab the spot on 10, your radio changes
frequency, and this is reported to HamTools. HamTools then tells the
amplfier to tune to the frequency segment for the specified frequency.
All this happens before you hit the key or mic. So there is ZERO delay.
The other cool feature is that if you have a Acom Antenna Switch, the
same software will automatically select the appropriate antenna for the
frequency (see next paragraph).

Antenna Switch Module:

- Allows you to define names for all 10 positions
- Allows you to define frequency ranges (any ham segment 3-30 MHz) for
each antenna
- Allows you to define if an antenna is the default antenna for a
specific segment.
- Has support for controlling up to 4 aux. relays, using the spare
pins on RS-232 ports on your PC. You can then use simple
saturated-transistor switches to control aux relays for each antenna
position. The aux switch positions can then be fully labelled.
- Using the PlugIn API, and the frequency definitions you have
specified, antennas will be automatically selected based on
frequency. The switch will return to the last antenna used if it
has been on a band before, or it will use the default antenna for a
frequency if one is defined.

This is a somewhat long-winded answer, but I know that others on the
list would like to know what's up also...

The good news is that the software will be free to Acom International
customers.

The bad news is that it is not released yet. There are still a few
tweeks to be worked out. I will let everyone know via the reflector
as soon as it is up on the http://www.w1ve.com/hamtools site.

Thanks for your interest.

73,

-Gerry, W1VE

Gerry, Thanks for the detailed message. I am very much looking foward to getting a copy of your software. I have been thinking of switching over to Writelog for my contesting operation. Now i can see this is the only way to go. Good bye DOS, hello Windows.
I use Win4dx as my every day logging program. I hope your software will work with this program too.

Topic: 298 Message: 306

Jim, Gerry & others,

Thank you very much for your responses & suggestions.

Apparently there is a problem with my Omni VI Plus, but only on 20M, which is strange. I get the "Detected RF Power at wrong time" fault only when operating on 20M, either into a dummy load or the 4elm monobander. It has nothing to do with the RTTY AFSK input or the VOX circuit, as it occurs one out of five times just keying the Omni in Tune mode. If I keep the drive down to 20w and am quick to go out of transmit, I do not get the subsequent. "Auto Protection Drive Power Removed, which powers the ACOM OFF. I operated many hours during the contest last night on 80, 40 and 15 with never getting the fault.

I figured that the RF was getting to the ACOM before the Omni TX relay pulled in -- The timing is close though, as the amp does not fault out all the time on 20M. It would be interesting to know what the timing is, in both the Omni and ACOM 2000A.

Friday night was the first or second time that I used the Omni to drive the ACOM. I usually drive the ACOM with my Mark V FT-1000MP. I am using the Mark V relay to ground signal to key the ACOM (goes to Key-In jack) I have operated plenty of CW and SSB on all bands and NEVER had the ACOM 2000A fault out for any reason.

So -- what did I do?? This morning I connected the Omni VI TX Out to the ACOM Key In and the ACOM Key Out to the Omni VI Key In. I disabled the mechanical relay in the Omni as well.

I operated much of today on 20M, 15M and 10M - at 1500 out on RTTY with the Omni VI driving the 2000A - As expected there were no problems at all! The ACOM 2000A performed flawlessly - It is absolutely wonderful to use in a contest.

I am going to borrow a dual trace scope from work to see just what is going on with the Omni VI. I will let you know what the results are.

It is a bit of a pain to have to use the Key in and Key out lines - Prior to today, I had the ACOM 2000A Key-Iin line connected to a A/B switch that allowed me to switch between the Omni and Mark V. Maybe I can still switch just the ACOM Key-In line between the Omni and Mark V and leave the ACOM Key-Out line connected to the Omni Key-In line.

I don't imagine that I am the first one to run across the problem of the Xmtr RF out and mechanical relay ground on transmit being to close time-wise.

Again, Thank you for the help -- (It is nice to be a member of the ACOM group)

73, Bill - K5YG

Guys,

Time for a complaint.

I know Gerry has been busy with this software.

I wanted to obtain the necessary protocol info to write my own software for special apps here. I was pointed to Gary or to the ACOM technical info E-mail address by Krassy.

To date I have received no information from either.

Shouldn't we have ready access to this data after spending $5500 for our box?

I already have a most of the program I want to use debugged an placed on a Basic Stamp. Problem is that I can get it to talk to the ACOM but the ACOM won't shut up. It keeps sending me the data I asked for over and over again.. Clearly there is something lacking in the protocol area in the documentation I have.

I see no reason for there be a monopoly on the use of ACOM network control.

Hi Bill,

Well, I am almost ready to release it! Too many honey-do's over the
weekend to get it quite cleaned up... Even wanted to get on and work
my buddies @ VY2SS in CQWW RTTY... but no go... They missed last years
M/S record score by only a few hundred points...

Anyway -- Sounds good. I hope you did not buy an Integra USB Serial Port.
I have a 4-port one... I bet I spent a month debugging the Acom software
looking for a bug -- the bug was the driver for the Integra -- it would
hang at random times. That particular unit is no longer made, so it is
probably not going to be the same. The best USB->Serial converters, and
serial boards in general, that I have found, are from comtrol (http://www.comtrol.com).
The Rocketport series is priced reasonably, and works great.

Hang in there with me -- I'll have the stuff to you in plenty of time for
CQWW, and if you find any bugs (What Bugs???) in the released code, I'll
respond quickly with an update.

73,

-Gerry

311. My ACOM 2000s in the CQ WW RTTY Contest

Yahoo group: acom-list (1999 — 2009)
Date: 2000-09-26 11:46:50 UTC
From: John Devoldere (ON4UN)
Topic: 311 Message: 311

Dear ACOM friends:

After having used the ACOM2000 for well over 2 years now, I had my first "problem" with "it" during the RTTY contest.

I had been running the units at (at least) 1500 Watt output (FSK, that is continuous carrier, through "relatively" short transmissions) when about 38 hours into the contest one unit simply quit (totally dead). I first checked the fuses (as I had never, ever yet had to even "look" at the amp, I did not even know where the fuses where...) and yes, one of the 20 Amp fuses was dead. And of course, I did NOT have a 20 Amp ceramic body fuse. So first I inserted a glass body 15 Amp fuse (which I had plenty) and fired it up. All seemed OK. I quickly tested it, and got fill power, no complaint! By then I knew what had been the problem: to much power for too long a time, and as a "slow" fuse is indeed a thermal "component", one fuse went. Next question: where do you find a 20 Amp ceramic body (slow blow) fuse on a Sunday afternoon. Well, the answer is simple: you don't. Back to the basics of amateur radio: MAKE ONE. After looking around in my workshop for the most suitable material, I found some copper tubing with a 6 mm diameter, which I used to make PA coils. The fuses are 1/4 inch, or 6.35 mm. Close. I cut the right length off the tubing, and increased the diameter at both ends by putting ample solder on it (see picture attached, showing the original ceramic body fuse, the low voltage glass fuze and the home made temporary "replacement" fuse).

Ten minutes later I was back in business. The current rating of that fuse? Maybe 1000 Amps, anyhow much more than the fuse socket. Don't worry, the amplifier has two fuses, one in each lead of the 230 Volt line. One is still the original one. This afternoon I will shop for 20- amp slo-blo fuses.

Apparently the power I ran for a prolonged time on RTTY was too much for the fuse, NOT FOR THE ACOM!

I just wanted you to know that after some 27 months of using the (first) ACOM2000 this is the only "problem" I have had with it.

I must admit it really is one of the very finest pieces of radio equipment I have ever owned, and certainly the best engineered and built amplifier around.

BTW, I made just over 2000 QSOs in the RTTY contest for approx. 3.6 Mi. claimed points. Using the set-up in a "assisted" category is just a joy, and changing bands is child's play. CONGRATS and THANK YOU ACOM for providing me with a piece of equipment that has given me so much enjoyment!

73

John, ON4UN

Hi John,

I used my ACOM2000A in a contest for the first time during the CQ/RJ WW.- What a joy! Once I figured out why the ACOM was faulting out with an "RF detected at wrong time" fault - It was steady ops at 1500watts out - I ran less hours than you -- so no blown fuses -

I like the 1000A fuse you made! - The old trick I have used is to wrap the blown fuse with either copper or aluminum foil.

I solved the ACOM faulting out on the drive reaching the amp prior to the Key signal, by connecting the TX control in and out from the Omni-6 to the ACOM. I wonder how much delay the ACOM would like to see?? That is, RF after Key to ground.

I spoke to Ten-Tec yesterday and was told that when using the Omni internal mechanical relay to key the amp, the RF will get there first. Now, why it only happens on 20M could be due to RF pickup or RF loop somewhere, or I may not have operated long enough on 40M Friday night to have it occur on that band.

I have used the ACOM with my Mark V much more on CW - and am using the ground-on-transmit relay in the Mark V to the ACOM Key input. Never had the ACOM fault out with the Mark V.

I love my ACOM Amp - It is the best made amp I have ever seen - and of course, a real pleasure to use. Now, if I could only move it outside into the shed next to my tower -- that will be next --

73, Bill K5YG

John,

Congratulations on your contest contacts/score -- and thank you for the contacts - I was wondering if you were using your ACOM - Acom to Acom - hi --

I ran my 2000A at 1KW out - It runs very cool at 1kw out - The right side of the amp became slightly warm - My unit does have the external fan.

At 1500 out, my 12 x 12ft room reaches 90f in a short time -- my wife suggested I install a vent fan in the celling. I suggested that I could relocate the amplifer to her bathroom - she was not wild about that idea! How do you get the heat out of your "shack"??

314. Heater lamp flashing

Yahoo group: acom-list (1999 — 2009)
Date: 2000-10-08 21:40:51 UTC
From: Bob Willis
Topic: 314 Message: 314

What does it mean when the heater lamp lights up for abt 1 ~ 3 seconds then shuts off for 3 ~ 30 seconds? The mains are set correctly and it doesnt seem to matter if I'm transmitting or idle. I havent noticed this happening before now but it's possible that it has, just never noticed.

Otherwise, this amp is the best investment I've made in Amateur Radio to date. Great job folks!

Bob ~ WJ1Z

Hi Bob,
This men that your mans voltage is not exactly 240 V. This si higher or lower
We have protection on the filament voltage of the tubes. And when the line is
not exact this only warning you that your line voltage is not exact. The next
steps is the protection will protect wilt the red light if the mans voltage
become less or more 10 % from The nominal value (240 v) .
Don't worry this will happen this is only a wording.

From: Gerry Hull
Topic: 316 Message: 316

Hello All,

I know you are all getting ready for CQWW in a couple
of weeks.

Saturday I gave a Release Candidate for Hamtools for Acom
to a few selected testers. Feedback so far has been very
positive. So, baring any major glitches, it should be in
your hands in the new few days!

Good News -- Support for LogWindows will be shipping with the
initial release.

73,

-Gerry, W1VE/VE1RM

317. Anyone using ACOM 2000A an Omni-VI ?

Yahoo group: acom-list (1999 — 2009)
Date: 2000-10-24 11:55:04 UTC
From: k5yg@aol.com
Topic: 317 Message: 317

Is there anyone out there using the ACOM 2000A with an Omni-VI Plus?

My 2000A will not let the Omni come out of transmit, when using the ACOM Key In and Key Out lines.

The ACOM Key Out line stays low and keeps the Omni-VI transmitting AFTER the Omni Key Out line goes high (when the Omni is switched back to receive). This keeps the Omni transmitting. Transmission can be stopped by taking the 2000A back to STB (standby).

Key In and Key Out voltage readings using a break-out box:

Omni Key-Out line to ACOM with Omni NOT Keyed = 10.12V
(ACOM Key-In line) Keyed = 83mv

ACOM Key-Out lint to Omni with Omni NOT Keyed = 9.03
(Omni Key-En line) Keyed = 1.83V

Once the ACOM starts transmitting, the ACOM Key-Out line stays LOW (1.83V) and the Omni keeps transmitting until I pull the ACOM Key-Out connector.

If I remove the RF Input from the ACOM RF input connector, and connect the Omni to a dummy load, the Omni goes in and out of transmit OK.

It does not matter what drive level I use, the problem exists when driving the ACOM with 1 watt or 50 watts.

I am discussing the problem with Paul at Ten-Tec. He suggested I try a couple diodes in series with the ACOM KEY-OUT line - made no difference --

There are some strange things going on: The problem does not occur with all of the Omni-VI modes of operation! The problem occurs all the time when switching the Omni to TUNE, while the Omni is in CW or FSK modes. It does not occur when going into TUNE from USB, LSB or FM. Paul is looking into this aspect of the problem.

Any ideas or suggestions???

319. Fixes to allow Ten-Tec Xcvrs to work with the ACOM 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2000-10-26 03:59:32 UTC
From: Bill Musa
Topic: 319 Message: 319

Hello ACOM Group:

I just uploaded a write-up and schematic(prepared by Vasco, LZ1JK) that fixes the Ten-Tec / 2000A compatability problem. Krassy emailed the fix to me yesterday -- Thank you Krassy --

I tested the "Simple Fix" tonight with my Omni VI and ACOM 2000A on QSK high speed CW -- all appears well - no faults to report.

The "Simple Fix" is to connect the Omni Key-Out to the Key-EN jacks with a RCA connector "T" cable. The common connector connects to the 2000A Key-In connector. The 2000A Key-Out is NOT used.

I sent the write-up to Paul Clinton (Service Mgr) at Ten-Tec -- He heard about the problem from a couple of us and is very much interested in fixing the problem.

Close . . . but not quite. I have been working closely with Gerry on the testing, and it is not yet ready for release. What I can tell you is that the debugging process is moving along. Gerry believes he has all the information from Bulgaria necessary to correct the problems in the communication protocol. He is quite upset that he was not able to make it come together in time for this weekend.

I don't want to set any expectations for delivery dates, but I can tell you that there is plenty of activity on this project. Gerry will be working on the fixes as soon as he returns from Canada [VY2SS] on Monday.

Hi all!

Two very interesting things just happened...

Just got done operating CQWW (tried a pretty serious effort this year) and really felt the need to make the jump to the HIGH category...

and...

My wife just 'ordered' another horse. We have two now and I have two towers. I've joked that I have to have an even tower-to-horse ratio for sanity (I'm not a big horse fan). Apparently, the horse was purchased 'on the sly' and when I found out she sheepishly asked if I needed another tower or something. WELL! I _do_ need an amp!

So, on to my question:

I seem to recall a while back that ACOM was running a special bundling thier switch with the amp - am I all wet on that or are they still doing it?

Thanks es 73!

Me, too. Had my Acom for a full year of heavy duty, 48 hour endless CQing contesting and had yet to have it even whimper. It doesn't even get warm! Amazing.

Now for my question. A few years back W0UN explained to me a system in which an autotune amp (in his case Alpha) could be used for BOTH transmitters in a single op two radio configuration. Eliminating the need for a second amp...in my case an AL-1500.

Anyone know how to do this?

Larry,

We have just used such a switch at LZ5Z in CQWW.
It is made by ACOM and works really fine with two
radios connected to one amplifier.
You however must use only YAESU radios since this
device works with TX inhibit function of the radios.

Nice piece of gear since in M/S it allows to use only
one signal at any time at running station while gives you
more flexibility with two radios on the CQ band.

Hope this helps there. Ask Krassi for more info.

73's de Wally LZ2CJ (LZ5Z in CQWW SSB 2000)

Larry,

It's all a matter RF switches. Contest software does put out a LPT port voltage which allows the active (ready to transmit) radio to be selected. One can use this to switch anything you want. Some logging software does the same (e.g. LOG-EQF).

This was my first SSB contest with the ACOM. I found out the wisdom of NOT remotely locating the amp. Using a station with the antennas tuned for the CW band plus the adrenaline of contesting resulted in quite a few trips especially when operating high in the band.

My previous experience in the RTTY contest generated only a few trips.

The amp is something. Nothing to worry about. It just puts out and protects itself if you abuse it.

My only gripe is that the band segments are too large-- especially on 10 meters with antennas having a rapidly rising SWR. I would prefer to have the option of half as many "antennas" and half as wide band segments.

I also just returned from V26B where I used my Acom 2000A on 15M.

We installed a delta loop as an alternate antenna to pick up South American multipliers when we're working JA's and it's swr was about 2:1. I used the tuning feature of the Acom and set it up on antenna 2 (A2) for the delta loop. It was easy to switch back and forth: right arrow, Enter; left arrow, Enter.

It worked great and we did the best we've ever done on 15m with 4739 qsos, 40 zones,162 countries.

I transported the Amplifier in it's original box and hand-carried the transformer in a bowling ball bag. The transformer got a lot of attention at the airport security stations.

One of the other V26B operators brought his FT1000MP in a very nice, heavy duty, professional transport case which caused me to wonder how much interest there is from this group for a possible group purchase / discount on a case like that for your Acom ?

The cases cost about $400 to $500, but to protect a much larger investment, it seems to be worth it to me. My cardboard box is quite beat up after two round trips to Antigua.

Let me know if you would be interested in finding out details.

Sounds like you had a great weekend. It was good to work you, Bob. 15 meter was definitely THE BAND for qsos [with reduced 10m prop on Sunday].

The surplus market turns up a lot of used transport cases . . . equipment cases and trade show cases. These are good options that often end up coming in under $100. But, of course, you can't get 'em all the time, and you have to carry a ruler to the store. There is a surplus electronics store that I recently became aware of [tnx W1VE], in southern New Hampshire that carries these cases occassionally. There may be a similar source in your neighborhood.

73,

Jim K1IR

RE: Re: [acom-list] ACOM

I also just returned from V26B where I used my Acom 2000A on 15M.

We installed a delta loop as an alternate antenna to pick up South American multipliers when we're working JA's and it's swr was about 2:1. I used the tuning feature of the Acom and set it up on antenna 2 (A2) for the delta loop. It was easy to switch back and forth: right arrow, Enter; left arrow, Enter.

It worked great and we did the best we've ever done on 15m with 4739 qsos, 40 zones,162 countries.

I transported the Amplifier in it's original box and hand-carried the transformer in a bowling ball bag. The transformer got a lot of attention at the airport security stations.

One of the other V26B operators brought his FT1000MP in a very nice, heavy duty, professional transport case which caused me to wonder how much interest there is from this group for a possible group purchase / discount on a case like that for your Acom ?

The cases cost about $400 to $500, but to protect a much larger investment, it seems to be worth it to me. My cardboard box is quite beat up after two round trips to Antigua.

Let me know if you would be interested in finding out details.

331. FT990 & ACOM 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2000-11-03 15:17:52 UTC
From: Brian Smithson
Topic: 331 Message: 331

Good morning!

Pretty exciting news - I just ordered a 2000A and Krassy was very helpful bringing me up to speed on all the features, etc.

Now that it's on the way, I've been reading things over to get ready and I've been looking into the amp's need for a 'ground to transmit' signal from the rig.

I wonder if any FT990 owners out there can give me a short-cut to getting this signal from the 990, and how best to configure the radio to work with this amp. The 990 manual goes into some detail about using the 'remote' jack (a multi-connector jack) to work with an amp. It looks like I have a couple of things to check:

1. Does the amp's 'ground to xmit' voltage exceed 50VDC or 500mA? That determines whether or not I need to enable an internal relay or use transistor switching.

2. The 2000A is QSK capable, and the 990 says 'if it is designed for QSK operation you will need to connect its exciter-enable output to pin 8 of the BAND DATA jack' presumabely to clue the 990 in on when the amp can accept signal.

Sure seems like someone would have solved this problem before, and/or hooked a 990 to a modern, non-Yaesu amp. Any tips?

Thanks and 73!

-Brian n8wrl

332. Re: [acom-list] ACOM and FT990

Topic: 332 Message: 332

Hi Brian,
All you need to make yourself is a control cable between FT990 "BAND DATA" connector and ACOM2000A "KEY-IN" and "KEY-OUT" sockets.

Use a piece of 5-10 feet (as needed) two-way screened cable, one DIN-8 connector for FT990 and two different color RCA phono jacks for ACOM2000A.

Please note that there are two nearly equal types of DIN-8 connectors on the market. One type is where all pins centers lay on an exact circle: these don't match FT990 rear panel connector. You would need a modified type, where two bottom pins are slightly distanced outside the circle - the "horseshoe" modified DIN-8.

Now look at page 7 of FT990 Operating Manual. Find BAND DATA connector description there.

- Connect one of the wires to pin 2 "TX GND" of DIN-8 connector and mark its end as "KEY-IN" for ACOM2000A;
- Connect the second wire to pin 8 "LINEAR" of DIN-8 connector and mark its end as "KEY-OUT" for ACOM2000A;
- Connect screening shield to pin 3 "GND"of DIN-8 connector ;
- Install two RCA phono-type jacks to the "KEY-IN" and "KEY-OUT" ends of the cable.

N O T E
======= When you insert the DIN-8 connector to the BAND DATA of FT990, transmission of the transceiver will be disabled unless you connect also "KEY-IN" and "KEY-OUT" to the amplifier. Even when amplifier is OFF or STBY, this connection will enable barefoot transmitting without cable reconnection. When however you disconnect "KEY-IN" and/or "KEY-OUT" from amplifier's rear panel for any reason, just disconnect also DIN-8 from FT990 "BAND DATA" to enable XCVR transmitting.

Since you are interested in technical details, here is more information about these signals:

1. The antenna relay T/R control input of the amplifier is called "KEY-IN". Its socket on the rear panel is phono type (RCA). When in OPERATE, on this input appears a DC signal which must be held to ground to activate the amplifier in transmit. This can be done via a relay contact or better a semiconductor (transistor or integrated circuit) with suitable polarity (positive to ground). The electrical specifications for the transceiver's output are: switching voltage (open circuit) minimum 12V, positive to ground; switching current (closed circuit) minimum 12mA; voltage drop or resistance @ 12mA current (closed circuit) maximum 1.5V/250 Ohm.

2. The KEY-OUT socket on the rear panel is phono type (RCA) too. This is an extra output signal from the amplifier to the transceiver. It could be used to improve the T/R switching process and increases the exploitation reliability of the amplifier. This output is usable when the transceiver has the respective input to disable transmitting when needed.

Since FT990 has a suitable input (called LINEAR - pin 8 on BAND DATA) which disables transmission, we recommend that you connect it with a shielded cable to the KEY-OUT socket of the amplifier.

The output KEY-OUT of the amplifier is open drain circuit and it can hold to ground a positive DC signal. At the moments when the amplifier is ready to transmit, this line is held to ground. When transmitting is not permissible, the output is open (for instance when the antenna relay is in process of switch-over or while the band switch is being rotated). The electrical specifications of the amplifier's output capability are: switching voltage (open circuit) up to +50V; switching current (closed circuit) up to 20mA; resistance @ 20mA current (closed circuit) maximum 120 Ohm.

When the amplifier is not powered, and also in STANDBY mode, this output is directly connected to the KEY-IN socket. This way, the amplifier will return the "ground on transmit" back to the transceiver's transmit-enable input, thus enabling barefoot transmission without any cable reconnection.

In OPERATE mode the KEY-OUT signal will follow the incoming on the KEY-IN socket "ground on transmit" always when the antenna relay and/or band switch are in safe position and will reject transmitting if any risk condition is detected. Nevertheless, the amplifier uses an internal self-protection which keeps track on the safe QSK T/R swhitching even when the KEY-OUT is not used.

From: ted demopoulos
Topic: 334 Message: 334

My heater light keeps coming on. On and off, never on for more than a few seconds, but very regularly. Doesn't seem to matter if I'm transmitting alot, or not at all. The manual (unless I missed it) doesn't say anytHing.

Check your line voltage.

You can use the built-in metering ability of your amplifier to do so.
You need to monitor "Mains".

I see this when my line voltage is a little low. The light indicates
that your getting close to going out of tolerance. I believe that the
amp will shut off if it goes too far.

Bob,

Thanks - makes much sense particularly as my other amp was putting out low juice during CQWW SSB, and haven't had time to investigate.

Now I wonder what would make the line voltage low, when its been fine since I had the 220 lines installed?

Well,

That depends. See what it is first. Then an investigation may be necessary.

Your power company is permitted to supply you with 240V +/- 10%. So, you may see from 216 to 244 and everything is OK. If it consistently stays low, you may want to adjust the setting in the Acom 2000 to match what you've got.

If the voltage varies a lot, there may be a problem somewhere and you might want to contact your power company or an electrician to have a look at it.

Power companies do vary their output voltage somewhat depending on anticipated load. As few people are using Air Conditioning in your area this time of year, they may drop it back a little. Here in Texas, people go immediately from Air Conditioning to Heating and a lot of it is electric heat so the load is pretty constant here as is my line voltage is 241V right now. This is what I usually see.

I have never had the heater light come on. My line voltage is very
constant at 248-250 V. Remember that there are several taps on
the transformer, for adjusting to your line voltage. Also, there is a
menu setting on the RCU for fine adjustment (high/low within the
xfmr tap range), which I believe makes some bias adjestments in
the amp.

Hi!
I have my amp wired for 240 V. My mains is seldom over 220 V
and somtimes as low as 210 V. My heater light comes on and
goes off quite often. I've been using the amp for almost two
years and works fine. Haven't worried much about this.

I had a similar problem, which was solved with
ferrites on the cable at both ends.

342. Heater light/now protect circuit

Yahoo group: acom-list (1999 — 2009)
Date: 2000-11-15 03:34:14 UTC
From: Bob Willis
Topic: 342 Message: 342

Hey Gang,

I reported a heater light intermittently flashing a couple of months ago, and now the problem seems to have escalated. Now the amp goes into protect about 3 sec after turning it on and it gives me the message "HEATER VOLTAGE TOO LOW : 0.00V " I measured the mains voltage @ 238v and drops to 237.5v when I turn the power on, but of course it stays on only abt 3 ~ 5 sec b-4 tripping the protect circuit. With contest season upon us, I hope it's not serious.
Any ideas would be appreciated.

I've some more experiences now.
Using a controlled main (output is 16A, variable abt. 180V ... 270V) I regulated onto 240V, measured by RCU-Menu "Measure / Main) and since that there is no flashing HEATER-light. Before the voltage was abt. 220V (as we used for a long time) light flashed abt. 10times per minute.

The time offset of about 3 ~ 5 sec You mentioned, seems to be the time between two measurements of HEATER-voltage. I assume Your main voltage breaks down for a moment (while switching on) and excites the self protecting circuits.

enjoy Your amp.

This sounds like the "molex connector" problem.

What you need to do is:

Disconnect power from your amplifier and wait 15 minutes or so.

Remove the cover using a #2 Phillips screwdriver on all of those
little screws.

Near the back of the unit, there is a white plastic Molex connector.
The individual pins of this connector move a bit and can become
disconnected from the mating portion on the opposite side of the
connector. Using two pairs of needle-nose pliers, and push each
opposing pair of wires towards each other while the plastic connector
is mated. This will assure that each individual connector contact is
in full overlap and this problem should go away.

I had it on mine initially and have not seen it after performing the
above procedure.

I heard that there might be an updated connector, but in my case I
don't think it's necessary to replace it.

Bob:

I had this very problem. Turned out to be a bad connector on the low voltage power supply board that feeds the tube filaments. I spoke with Krassy and he suggested sending it back which I did. He had if fixed promptly and sent it back. Hated to send it back, but the service was very good. That was several months ago and have not had a problem since.

You may be able to get it fixed at your place with a some guidance from Krassy.

GL.

Hi To all,

I just got my new Acom 2000 A, including all availb.options. I left the Mains at 240 V (Factory default) . The Mains is 227 v - 228V . Probably I should change the mains to 220V. There is two different positions for 220V (see draw technical supplement) . Unfortunately one can not see the major differences.
Couls anyone give an aswer?

Thank in advance 73

352. Amp failure help needed

Yahoo group: acom-list (1999 — 2009)
Date: 2000-12-03 05:56:12 UTC
From: alsopb@gloryroad.net
Topic: 352 Message: 352

It's 2AM Saturday night of the 160M contest...

Perhaps somebody can provide some help to get amp going before I talk to Krassy on Monday.

Amp experience a number of bias voltage too low trips while in operate mode. Amp now has 414 hours on it.

They all reset fine except the last one. It would not reset and RCU froze.

Turned amp off. Waited. Tried restart.

It goes through the start sequence fine. When it reaches the end a servo motor wirrs and doesn't stop. It just continues.

I opened up amp and reseated all the connectors. No help.

Tried the full off/restart sequence several times. No luck.

de Brian/K3KO

353. Amp failure help needed II

Yahoo group: acom-list (1999 — 2009)
Date: 2000-12-03 13:51:26 UTC
From: alsopb
Topic: 353 Message: 353

Was able to get the amp stop the continuous servo activation by the DEF menu which reset the tunings to default.-- apparently some wacko data got into the USR defined settings via the fault.

I now have a solid error on transmit (no drive): "IP=1020 ma should be zero." This kicks the amp off.

In the standby measure menu, the screen voltage is 6 volts. It normally was 340 volts. Plate voltage =2.75Kv and grid bias voltage =-123 volts are a pre-failure values. Everything else I can measure in standby with the RCU are pre-failure. Don't know operate values, but I assume that the grid bias changed to permit current flow. The screen voltage is noramlly the same in op/standby.

Looksl like something died in the screen voltage circuit. There appears to be some kind of TIP VR/IC or switching transistor (IRF830?) connected across the PC board at the +430 volt three hole area where a connector might have been placed. It's mounted on the front panel.

Could someone take a look at theirs to see if there is something unusual about the connections? Voltage measurements at this point would help.

Any suggestions?

I have the MP / ACOM combination. They are fantastic together. I only operate CW but what a great combo. Used the MP/ACOM with a 160M Windom and a 160 Folded Monopole in CQ 160 DX test last Jan. - We placed 7th in the world, not one pause or glitch the entire contest. If I can hear em' I can work em' any band just with the Windom.

QSK is best I have ever used, easy full power out with minimum drive. Silent, cool running and auto tune any frequency 1.8 - 30 Mhz with one dit on the key.

I concur with Larry's comments. Been using them together for about 18 months, and they're both a pleasure! Unless you're doing high speed QSK CW, there's no need for keying lines, you just run coax between the two, and the ACOM does the rest. Change bands, key up and the ACOM is tuned in under a second! WONDERFUL for quick band changes. The ACOM is also very bulletproof in protecting itself from problems. If you overdrive it, have too high a mismatch, low power mains, switch the AMP on while RF is applied, or do other stupid stuff, the amp will shut down in milliseconds and tell you why it did so. Amazing piece of gear.

Good luck & 73,

Dan

ACOM does the rest. >>

I concur with both Dan and Larry -- I have been using them together for about
6 months. I have run high speed QSK CW with my Mark V and ACOM without keying
lines --- The ACOM has not tripped off yet!

It is another story with my Omni VI Plus - The Omni keying relay is as slow
as a snail! - The relay output cannot be used to key the ACOM. The Omni
Key-Out & Key-En lines must be used --- The Omni Key out /EN lines must be
connnected together and run to the ACOM Key-in line.

The ACOM with Mark V is absolutely wonderful!

Topic: 359 Message: 359

Guys,

Krassy finished repairing my amp within days of receiving it.

Great turnaround. Now if UPS would cooperate. I got a bit nervous in the shipment to Krassy when the amp sat for 36 hours (according to their tracking info) 50 miles from Krassy's shop. They guaranteed 3 day delivery and were determined to deliver it on the 35.996th hour I guess.

Problem was unusual - tube grid to cathode short. Difficult to diagnose
cold. Protection system prevented failure of any other component. (Unlike some other amps I have had ....)

Previous postings describe the symptoms.

I'm expecting my amp tomorrow or the next day (Thanks Krassy!) and
I'm curious what percentage of amplifiers develop this problem. I'm
guessing and hoping it is very small! Krassy is being very proactive
and has asked me to call him just before the smoke test to ensure
all is connected properly. I'm happy to do that but I wonder if that
would have prevented Brian's problem?

According to Krassy, this was the first one! They never had
experienced such a failure before. The tubes apparently have a good
reputation.

Just to clarify for you Brian, this was a tube failure - not the amplifier. As K3KO commented, the amp would not let the tube damage the amp any further. Amazing.

Also, for everyone else, if you haven't looked into it, these tubes are fairly inexpensive at less than $200 a matched set. Not a bad investment.

Ah, thanks Bob! Should have known.

Where did you find the spare tubes? Can we buy them from
ACOM?

There are several sources for the tubes.

I bought mine from "Tom's Tubes" in Florida.

http://msnhomepages.talkcity.com/ClassifiedsCt/tomstubes/

He lists them at $190 a pair plus shipping.

365. ACOM-ACOM2S1

Yahoo group: acom-list (1999 — 2009)
Date: 2000-12-18 03:06:16 UTC
From: aa1nd@aol.com
Topic: 365 Message: 365

For Terry Schieler, W0FM:
Hi Terry,

The ACOM system can be built using any model of amateur transceiver. Only the ACOM2S1 XCVR commutator (two transceivers to a common amplifier) requires a special transmit-disable signal, that is not available on some models.

When FT1000MP is used, the ACOM system utilizes its "TX GND" and "TX INHIBIT" signals, available on BAND DATA connector of the transceiver to control the receive/transmit switching process. These are directly connected to the "KEY-IN" and "KEY-OUT" connectors of the ACOM2000A amplifier (if no ACOM2000S antenna selector nor ACOM2S1 XCVR commutator is present). The corresponding KEY-IN/KEY-OUT signals of each unit, when added to the system later, is "daisy chain" (OUT-IN-OUT-IN ...) connected to the existent cabling in order to form a closed loop.

The proper band-data signals (data A...D, available on the BAND DATA connector of FT1000MP), are not used by the ACOM system. The amplifier utilizes an own frequency meter instead.

The CAT-jack of FT1000MP can be used by a PC via the ACOM DOS software. It is connected to either COM1 or COM2 serial port. The other PC port is connected to the amplifier's serial port (or to the antenna selector if available) in order to form a common system. See II below for details.

The ACOM2000SW remote antenna switch interfaces with the ACOM2000S antenna selector only and is supplied with an own control cable.

I. Here are more details about the KEY-IN and KEY-OUT signals of the ACOM2000A amplifier. The other ACOM units have similar inputs and outputs.

1. The KEY-IN socket on the rear panel is phono type (RCA). This is the transmit/receive control input of the amplifier.

When in OPERATE, on this input appears a DC signal which must be held to ground to activate the amplifier in transmit. This is done via a transistor in FT1000MP - the TX GND signal which goes to ground on transmit. The electrical specifications of the amplifier's input are: switching voltage (open circuit) minimum 12V; switching current (closed circuit) minimum 12mA; voltage drop or resistance @ 12mA current (closed circuit) maximum 1.5V/250 Ohm.

2. The KEY-OUT socket is phono type too. This is an extra output signal from the amplifier to the transceiver. It could be used to improve the T/R switching process and increases the exploitation reliability of the amplifier. This output is usable when the transceiver has a respective input

to disable transmitting when needed. If your transceiver has not such an input, don't worry - the amplifier will function normally as well and then the KEY-OUT may remain unused.

Anyway if your transceiver has a suitable input which disables transmission, we recommend that you connect it with a shielded cable to the KEY-OUT socket of the amplifier. In FT1000MP this is the TX-INHIBIT.

The output KEY-OUT of the amplifier is open drain circuit and it can hold to ground a positive DC signal. At the moments when the amplifier is ready to transmit this line is held to ground, When transmitting is not permissible the output is open (for instance when the antenna relay is in process of switching or the band switch is rotated). The electrical specifications of the amplifier's output are: switching voltage (open circuit) up to +50V; switching current (closed circuit) up to 20mA; resistance @ 20mA current (closed circuit) maximum 120 Ohm.

When the amplifier is not powered and also in STANDBY mode this output is directly connected to the KEY-IN socket. Then the amplifier will return the "ground on transmit" back to the transceiver's transmit enable input. This however is not true about the antenna selector and 2-XCVR commutator (you cannot use the system if either the antenna selector or the 2-XCVR commutator is not powered.

In OPERATE mode the KEY-OUT signal will follow the incoming on the KEY-IN socket "ground on transmit" always when the antenna relay and/or band switch are in safe position and will reject transmitting if any risk condition is detected.

II. The ACOM software for antenna tuning management is available for DOS. It only distributes the information about frequency segments, bands and antenna numbers between subordinated units, while the proper automatic antenna matching process is done by the amplifier's firmware.

A newer WINDOWS application is on way, that offers control of all operative functions of the amplifier and antenna selector. It is prepared by Gerry Hall/W1VE, but only a beta version is available for now.

The DOS software description follows:

This program will control via PC the ACOM2000A Automatic HF linear amplifier, the Automatic antenna selector ACOM2000S, including the Remote antenna switch ACOM2000SW (option), and FT1000MP, FT990 or FT900 CAT transceivers in an automatically tuning radio system. The availability of a CAT transceiver or automatic antenna switch is not obligatory but is much more comfortable.

Using FT990 or FT1000MP will fully automate not only antenna selection and impedance matching, but also the drive frequency change and drive start/stop during the whole process, while tuning up to 10 antennas per frequency segment.

The program offers the unique (at the present time) possibility to describe your antennas frequency coverage in the PC memory, using several narrow-band segments for 10 different antennas. You can then comment them, tune them automatically, and finally, archive all the information and tunings in a file. You can retrieve this information from the PC at any time later and pass it into amplifier's nonvolatile memory without any on-air emission. Some technical aspects on using the program are listed below.

1. The program is intended to be run in DOS environment. It is not needed any installation procedure. Make a new directory (folder), for example ACOM2000A and copy the Acom.exe and Acom.set files there. These both files are absolutely needed to start the program. The following information concerns the version dated: Acom.exe/1999 June 04 and Acom.set/1999 May 17.

2. Now you can execute the program. Being in DOS input ACOM via the keyboard. The Acom.set file loading must complete for several seconds and you will be asked for the "lastfile.set" - replay "Ignore". After the first and every consecutive start up of the program it will create this file automatically. A blue coloured screen will appear to show the main program menu.

3. The main program menu consists of 6 (blue) lines on top of the screen and a table below them for tuning requests. The top 6 lines are for commands and informations. The coloured "hot keys" are activated by pressing Ctrl+... and they activate the following functions:

NEW - to create a new user file with cleared comments and request table.

CLEAR - to clear the whole request table but not comments and options.

READ - to read an old user *.tun file in the current directory.

LOAD - to write out the motor settings from the currently opened file to the amplifier's nonvolatile memory.

DUMP - to read in the motor settings from the amplifier's nonvolatile memory to the currently opened file (the opposite of LOAD).

AUTO - to select AUTO-TUNE sequence options and to start it. A window in the right-top corner is opened. You can select the combination of table symbols (**, OK or ??) to be tuned in a row or column sequence.

OPTIONS - to fill in the file comment field, antenna comment field, type of the antenna selector and transceiver, communication ports (COM1 and
COM2) assignment, and other options, including the table colours, etc. Follow the menu instructions to select options.

SAVE - to save the current state in a file. The user-created files will have the extension *.tun and an user-chosen name. Certain combinations of antennas and tunings for them can be stored there along with all table
requests, motor settings and dates for them, and all Options (user's comments, selected screen colours, etc).

QUIT - to exit to DOS level. A "Lastfile.set" file is automatically created. It saves the name of the last used user-created file (to be opened at the next program start). If the "Lastfile.set" does not exist, a new "Unnamed.tun" file is created (until you change the name and save it).

TUNE_CURRENT - to tune the current cell only.

POS - to display the motor settings for the current cell.

INFO - to monitor the amplifier's INFO-BOX. After the monitoring you will be asked whether an user-named "Name.box" file to be created or not. This
file will be in a simple text format. It can be read, printed or mailed at any time later. All text programs, even the "type Name.box" DOS command will do to read its contents.

Moving through the table is done via the four arrows, PgUp, PgDn, Home, End, and F1...F9 keys. Cell requests are made in two ways: consecutively via SPACE-BAR and alternatively via Enter or Ins keys. The requested cells are marked with "**". After tuning a "**" cell, the mark becomes "OK" when good or "??" when bad tuning results. The Ins key can be used also to delete an existing mark or to make ** from a ?? or OK mark.

6. PC serial ports COM1 and COM2 are to be used to control the amplifier and the transceiver respectively (can be interchanged via the Options).

C A U T I O N ! Note that FT990 and FT900 are to be controlled from PC via an
============= additional level converter to match the 0/+5V levels in the transceiver to the +/-12V standard levels of the serial PC ports. Failing to put it may result in DAMAGING both: the transceiver and/or the PC.

A simple level converter schematic diagram is available at ACOM Ltd. The cabling for FT990 and FT900 must match the level converter construction.

a) In order to control FT1000MP you have to prepare an interface cable as described below (or you can buy it readily as a "standard" type).

FT1000MP to PC cable:

female CANNON-DB9 female CANNON-DB25 female CANNON-DB9 Signal Name (FT1000MP) (COM2 - PC) (COM1 - PC) (FT - PC)
nr. 2 nr. 3 nr. 2 TxD-RxD
nr. 3 nr. 2 nr. 3 RxD-TxD
nr. 5 nr. 7 nr. 5 Signal Ground
metal case metal case + nr.1 Cable Shield + Chassis Ground

b) A "null-modem" type cable is needed for ACOM 2000A and it may be home-made or you can buy it, but all extra connections must be cut. ONLY(!) the connections listed below should remain connected there because of the +/-18V.

ACOM2000A to PC cable:

female CANNON-DB9 female CANNON-DB9 female CANNON-DB25 Signal Name
(ACOM2000A) (COM1 - PC) (COM2 - PC) (ACOM - PC)
nr. 2 nr. 3 nr. 3 RxD-TxD
nr. 3 nr. 2 nr. 2 TxD-RxD
nr. 5 nr. 5 nr. 7 Signal
Ground
metal case metal case metal case + nr.1 Cable
Shield

NOTE - Do not forget to connect the shield braid on both cable ends!

Please check the appropriate OPERATING MANUAL for additional information on cabling the Automatic antenna selector ACOM2000S, including the Remote antenna switch ACOM2000SW.

7. First connect a common grounding cable between the PC, XCVR and amplifier. Then connect the interface cables and start the equipment. After the warm-up period of the amplifier, start the "acom.exe" program.

8. Position the marker over the cell where you have a good antenna available and try the TUNE_CURRENT command first. The process will take 3-4 seconds.

9. Mark all cells where you have appropriate antennas. Start AUTO command and select "Yes" for the mark "**". The SEQUENCE selection determines whether:
a) COLUMNS: all frequencies will be passed before an antenna change occures;
b) ROWS: all antennas will be passed before a frequency change occures.
Now select START, adjust the drive power and then look how the antennas, transceiver frequencies, amplifier frequencies, and tuning procedure run automatically. You can break the procedure via pressing ESC or wait to its finish.

10. After AUTO ends, run SAVE. You will create an user file "Name.tun" which will archive the current tunings information as it was described above.

III. Only the cable extender for the ACOM2000A amplifier's RCU (10m/30 feet) and an additional external fan are offered as an option. The DOS software is free.

The amplifier is delivered without control cables since different transceivers need different cables.

Appropriate control cables are delivered with the antenna selector and antenna switch.

Only the 2-XCVR commutator completing cables are directly suited for two FT990 or FT1000MP transceivers since the commutator uses their "TX INHIBIT" signals to protect the second RX input, and also against simultaneous transmission. These cables can be adapted for some other models, but not anyone model is suitable to be used.

It's not a problem to order any other cable set as needed after you specify your system components.

Best 73! Vasco, LZ1JK , KrassyK1LZ
ACOM International,Inc, 13 December 2000.

Topic: 366 Message: 366

In addition to the given information by Vasco and Krassy,
the FT890 CAT behaves exactly in the same manner as FT900 CAT.
So You can use the DOS soft also in connection with the FT890;
it's going well.

I got lots of data and stored them.
Of course, the last 12 protection action are well known.
But how to interpret the gotten data from antenna tuning ?

I'm going thru withdrawal - I'm in FL visiting my folks and the new amp is sitting idle at home. I've had it about five days and I miss it already!

73 and merry xmas all!

Theres a fix to that Brian:

Run remote control with a Kachina 505dsp.

372. 2000A and 2000SW insertion loss

Yahoo group: acom-list (1999 — 2009)
Date: 2001-01-02 15:07:23 UTC
From: Brian Smithson
Topic: 367 Message: 372

Happy New Year, everyone!

I'm in the process of documenting my station and running
the FCC RF exposure analyses for my beams and I wonder if
anyone has any data on the insertion loss of the 2000A and
2000SW. Obviously the loss for the 2000A isn't interesting
for the RF exposure stuff but I am interested in doing
some comparative RX stuff too.

Thanks es 73!

-Brian n8wrl

Properly operating the "insertion loss" of the 2000A is +14.5db
relative to 50 watts.

Frankly, I don't know what you are asking. If you never use the amp,
take it out of the circuit and the loss is zero.

If you use it, then you have to do the evaluation at the output power
of the amp. Loss calcs then start at the amp and go to the antenna.

Sounds like you're trying to play games.
Having done these analyses, you won't get into trouble at 1500 Watts
output if all your antennas are 20-30' away from people.

Hi Brian!

Thanks for the reply. I'm pretty sure I messed up my message :)
I'm interested in two things:

1. Loss from the amp to my beams (I understand the amp has
'negative loss' :)) but the switch doesn't and I want to run thru
the RF exposure worksheets and be as accurate as I can to figure
power at the antenna (after the loss in cables, connectors,
switches, suppressors, etc).

2. I'm interested in the loss the amplifier itself imposes in
the RX _from_ the antenna as well. No particular reason, just
like to know what the whole 'system' is doing.

No games :)

Thanks!

Hi Will,

This software project has taken much
much too long. There have been a lot
of delays which have nothing to do
with Acom! (They are due to my time
constraints).

I am in the final stages. Currently
waiting for a email response from Vasco
about one final issue.

Too good things I can tell you:
1. LogWindows support is built in and works
great.
2. The software will be released as freeware.

No promises on the date, but I am pushing
for this month.

Gerry, W1VE

Hi Jim,

I run the ACOM full bore 1.5KW RTTY and temp never gets hot enough for
fan to operate. However, my amp is out in the open. Can't say what
it would be like for amp located under desk or in a closet!

The shack does get hot! Have to use ceiling fan and open windows...

My objective with ACOM was to have a quiet amp. The extra fan ACOM
supplied (which I did not hook up) made more noise than the amp
itself. It also blocks some of the air flow for the input air.

Tnx, Bob. I figure that if tube longevity is related to envelope temperature, it's better to have more air flowing all the time. You amuse me by the heat comment, because I noticed that the amp, under the desk between my legs, has been causing me to overheat where I don't particularly need it! So I'll move the amplifier to the other side of the shack, where I think the noise of the two fans, assuming I get the second one, will not be a factor. I operate mostly cw anyhow, with headphones, so fan noise is irrelevant.

73,

Jim, N3JT

Bob - I thought it was programmed to energize when the amp is on, i.e., after the warmup period, but apparently that is not correct.

Installed my Acom in the basement where my coax comes in the house. Turn it on when I come in the shack in the morning and turn it off when I go to sleep. No heat or noise in the shack, just the remote control unit.

By the way, I got the external fan, which runs all the time on my amp. Cut up a good furnace filter which I attached to the external fan to give a stage of cleaning.

Subject: Re: [acom-list] Query re: FAN

Hi Jim,

I run the ACOM full bore 1.5KW RTTY and temp never gets hot enough for fan to operate. However, my amp is out in the open. Can't say what it would be like for amp located under desk or in a closet!

The shack does get hot! Have to use ceiling fan and open windows...

My objective with ACOM was to have a quiet amp. The extra fan ACOM supplied (which I did not hook up) made more noise than the amp itself. It also blocks some of the air flow for the input air.

I have 2000A S/N 116 (purchased in June 2000) It came with the optional fan "factory installed" by Krassy. I use the Amp for RTTY contesting - Other than RTTY contesting, I see no need for the optional fan. I ran the Amp at 1.5kw out for 24 hours during the ARRL RTTY Roundup last month -- No problems -- Ran cool & Quiet -- the cabinet became slightly warm.

The optional fan runs all the time and increases speed when tube air exhaust temperature rises to between 93 - 97C. The fan speed decreases when the exhaust temp falls below 83c. The "optional fan" does make more noise than the internal fan, but is quiet as a mouse compared to my AL-1500! I can't stand to use my AL-1500 due to the noise and heat it throws out!

Here are some Acom 2000A key-down temperature readings with the optional fan installed:

2 minutes key down at 1kw output
F=14.088
Pin=45W
Input Pwr= 2.13kw

F=95 degrees C
R=91 degreec C

3 minutes key down at 1kw output

F=95 degrees C
R=93 degrees C

The Acom 2000A is the best amplifier I have have ever seen in my 46 years in this hobby.

My fan was also installed by Krassy. It runs all the time, and my
amp has never gotten above 80 deg C, so don't know about it
speeding up. I've also run it hard in the CQWW RTTY contest and
the cabinet just gets warm to the touch!

Howdy,

I recently received my new ACOM 1000A serial 000001! Well, I had a chance to give it a good workout on 6M during the ARRL January VHF contest.

I'm pleased to report flawless performance. We ran upwards of 1150 watts on peaks and the amp never complained. I received good reports from station close by concerning cleanliness of signal.

Typical ACOM performance!

Very interesting. It would be nice to see whats inside if you can send a
picture of the works? And maybe the schematic. To me it looks very similar
to the EMTRON DX1? What is the factory price?

I am actually interested in a manual tuned 2000 that would be cheaper..

I am also waiting for a 2 meter amp.

Hi Arliss,

Yes, the 1000A is the manual tune 160-6 1kW amp. Got it from ACOM. The amp was ready to be sold in the US quite a while ago, but the FCC type acceptance paperwork hadn't arrived until recently. I understand about 70 have been shipped to folks in the US so far.

Love it so far. Tuning is real fast, easy and stable. It weighs in at 40 lbs, so it's easy to move around. If I had one complaint, it's the LCD display. It has a fairly narrow vertical view angle. You need to be looking almost directly into it to read it in the vertical plane. It's not bad in the horizontal plane. I plan to have the amp mounted near eye level so it's no big deal.

It's extremely quiet in operation. I can barely hear the fan when I'm right next to it. My FT-920 makes more noise going into transmit/receive than the ACOM. The metering is excellent.

For a look at one, check:

http://www.vinecom.co.uk/ACOM1K.html

Everything above is based on only 2 weeks with the amp. Ask me again in 6 months how it's going!

73,
Mike, N1JEZ

The switch is, per the operating manual received from ACOM this week, is called the ACOM 2SI automatic XCVR commutator, designed to allow two transceivers to use a common load. Control cables are directly suited for Yaesu FT990 and FT 1000MP. Features stated: Fully automatic, QSK in CW mode is standard, Up to 200W through-line power, VSWR below 1.1:1 (1.8-54 MHz); below 1.2:1 up to 80 MHz, Single 12VDC/30mA power supply (fed from transceiver). No price, availability info.

401. Acom transmit/relay switch

Yahoo group: acom-list (1999 — 2009)
Date: 2001-02-24 01:06:21 UTC
From: k2at@home.com
Topic: 401 Message: 401

I use QSK all the time with my acom 2000 and have had a problem with two separate transmit/relay switches. I have hot switched them both thru normal use and have had to replace both of them. When they locked up I got the error message which states "Antenna relay closed it should be open". Either I got the only two switches which were defective, or the switches themselves are of poor quality. Has anyone else had a similiar experience? Mel

402. Re: Acom transmit/relay switch

From: dick.green@valley.net
Topic: 401 Message: 402

Mel,

I installed my brand-new ACOM 2000A yesterday and had exactly the same problem within 24 hours.

During initial testing after tuneup, the amp appeared to work OK in VOX mode. But several times I got "Relay is open, it should be closed" and the amp dropped into Standby. Putting the amp back into Operate cleared the problem. Today, while using QSK, I got "Relay is closed, it should be open" and the amp shut down. Attempts to restart the amp have failed -- a second or two after power up it displays "Relay is closed, it should be open" and shuts down again. The amp is dead in the water, so I assume the relay contacts are fused (bummer!)

The rig here is an FT-1000MP. I used the solid-state QSK connection method, with the amp's KEY IN jack connected to the MP's Band Data pin 2 (TX GND) and the amp's KEY OUT jack connected to the MP's Band Data pin 8 (TX INH). Pin 8 is connected to +13.8VDC through a 10K-ohm pull-up resistor.

When the initial problem occurred, I discovered that when I pulled the connection between KEY OUT and TX INH, the MP was still sending RF after switching. In other words, TX INH was not working. It turned out that the cable was faulty -- I think pin 8 was shorted to ground inside the plug, effectively disabling the TX INH function. So, a few words of code were sent with the QSK system not properly connected.

Without TX INH working, the MP's QSK transmit delay parameter governs the timing. The MP was set to delay RF for 5ms after switching (menu item 7-4), which might not have been quite enough time. Depending on how much switching voltage ACOM uses, 8ms-10ms delay or more might be required (higher switching voltage can make vacuum relays switch faster.)

The amp continued to function properly in both VOX and QSK mode for a while after I got the first set of faults and fixed the cable. I had just finished working D68C on 80M this evening when the fatal fault occurred. The TX INH system was working properly at that time.

It's hard to believe that just a few words of code sent with incorrect timing destroyed the relay contacts. I've never had a problem with Jennings or Kilovac vacuum relays fusing because of hot switching -- and I've driven several of them from the notorious FT-990, which has only a couple of milliseconds delay between T/R switching and RF. In fact, Krassy loaned me his ACOM for ARRL DX CW and I used it in QSK mode with the same MP setup successfully without

ever driving either error message (I don't know if the cable was
shorted while that was going on.)

But all of that should be a moot point -- I assume that the ACOM
firmware is supposed to check incorrect T/R sequencing *before* the
hotswitching occurs, and that's what the first error message was
about.

I think there are several possible causes:

1. Hotswitching and ACOM's T/R error detection doesn't work properly
2. ACOM has a batch of defective relays
3. ACOM relays are of poor quality
4. All of the above

A few questions for you:

1. What rig are you using?
2. How is the T/R system setup for QSK?
3. Did you have to ship your amp back for repair or did ACOM ship you
a relay that you replaced yourself? If the latter, what was the
procedure?
4. Is the relay US-made or Bulgarian? It looks a lot like a Jennings
or Kilovac, but I didn't look all that closely.

Dick, Tnx for getting back to me. Let's c if I can answer ur questions. First of all, what u descrive is exactly what was happening to me only my cables were fine. I am using a Yaesu ft1000d and had the distinction of fusing two relays. By the way, the relays are Kilovac relays. I wish they were Jennings. I sent the rig back to Krassy the first time and UPS destroyed the amp totally. It was insured, of course, but they refused to pay. Said it was packed improperly although it was the original packing. The second amp and new relay also went south on me and I told Krassy to send me a new switch. Did not want UPS problem again. I am not electronically inclined, however it was a simple job to replace. Top and front cover have to come off. I am now on third relay and although it has not seized up on me yet, I have gotten a few messages saying relay closed should be open. so far it has not fused. Krassy said they had gotten a bad batch of relays, but I believe the switching mechanism needs a protection circuit which only allows rf when the rig is ready. By the way, Dick, my rig is also brand new. Only a month old. I am hopeful that the software will possibly resolve this problem. I will never use UPS again (Krassy gave me a new amp free) and I don't recomment u send it back. U sound like u can solder the relay in yourself.

What is the status of ur rig now? Is it dead in the water? Mel PS If they solve this problem, the rig is great.

Subject: [acom-list] Re: Acom transmit/relay switch

Mel,

I installed my brand-new ACOM 2000A yesterday and had exactly the
same problem within 24 hours.

During initial testing after tuneup, the amp appeared to work OK in
VOX mode. But several times I got "Relay is open, it should be
closed" and the amp dropped into Standby. Putting the amp back into
Operate cleared the problem. Today, while using QSK, I got "Relay is
closed, it should be open" and the amp shut down. Attempts to restart
the amp have failed -- a second or two after power up it
displays "Relay is closed, it should be open" and shuts down again.
The amp is dead in the water, so I assume the relay contacts are
fused (bummer!)

The rig here is an FT-1000MP. I used the solid-state QSK connection
method, with the amp's KEY IN jack connected to the MP's Band Data
pin 2 (TX GND) and the amp's KEY OUT jack connected to the MP's Band
Data pin 8 (TX INH). Pin 8 is connected to +13.8VDC through a 10K-ohm
pull-up resistor.

When the initial problem occurred, I discovered that when I pulled the connection between KEY OUT and TX INH, the MP was still sending RF after switching. In other words, TX INH was not working. It turned out that the cable was faulty -- I think pin 8 was shorted to ground inside the plug, effectively disabling the TX INH function. So, a few words of code were sent with the QSK system not properly connected.

Without TX INH working, the MP's QSK transmit delay parameter governs the timing. The MP was set to delay RF for 5ms after switching (menu item 7-4), which might not have been quite enough time. Depending on how much switching voltage ACOM uses, 8ms-10ms delay or more might be required (higher switching voltage can make vacuum relays switch faster.)

The amp continued to function properly in both VOX and QSK mode for a while after I got the first set of faults and fixed the cable. I had just finished working D68C on 80M this evening when the fatal fault occurred. The TX INH system was working properly at that time.

It's hard to believe that just a few words of code sent with incorrect timing destroyed the relay contacts. I've never had a problem with Jennings or Kilovac vacuum relays fusing because of hot switching -- and I've driven several of them from the notorious FT-990, which has only a couple of milliseconds delay between T/R switching and RF. In fact, Krassy loaned me his ACOM for ARRL DX CW and I used it in QSK mode with the same MP setup successfully without ever driving either error message (I don't know if the cable was shorted while that was going on.)

But all of that should be a moot point -- I assume that the ACOM firmware is supposed to check incorrect T/R sequencing *before* the hotswitching occurs, and that's what the first error message was about.

I think there are several possible causes:

1. Hotswitching and ACOM's T/R error detection doesn't work properly
2. ACOM has a batch of defective relays
3. ACOM relays are of poor quality
4. All of the above

A few questions for you:

Guys,

I am sorry for the failures. However......

Hot switching destroying T/R relays is nothing new. The ACOM amp isn't magic, it takes time for the relay to switch over and bounce a few times before solid contact is established.

When the MP first came out lots of other amps' T/R relays got destroyed.
It got so bad that some contest software delayed the rig keying half a character after it send the PTT signal.

IMHO the best route is NOT to depend upon rig inhibit circuitry to work. One should try and understand what the RF output delays (relative to the T/R signal) from the rig are and adjust them to allow for amp switchover time. You are not going to do better than this even with inhibit circuitry. I understand MP's have such an adjustment. A number of software logging programs also have such a delay one can dial in.

For years, I couldn't understand all the reported failures since I had used a TS450/TS850 and never had failures (w/o any inhibit signal). It turns out the KENWOOD introduces almost 20ms of delay between the initiation of the T/R signal and RF output. I had lucked out all these years. 20ms probably is overkill but it gives you some idea of what will work.

In the world of sub-nanosecond techonology, I have never understood why it is so difficult to produce break-in keying which doesn't destroy anything and yet sounds good. It just seems to be a matter of knowing all the timings.. However, this info isn't generally available. Were talking milliseconds not picoseconds here.

> Dick, Tnx for getting back to me. Let's c if I can answer ur questions. First of all, what u descrive is exactly what was happening to me only my cables were fine. I am using a Yaesu ft1000d and had the distinction of fusing two relays. By the way, the relays are Kilovac relays. I wish they were Jennings. I sent the rig back to Krassy the first time and UPS destroyed the amp totally. It was insured, of course, but they refused to pay. Said it was packed improperly although it was the original packing. The second amp and new relay also went south on me and I told Krassy to send me a new switch. Did not want UPS problem again. I am not electronically inclined, however it was a simple job to replace. Top and front cover have to come off. I am now on third relay and although it has not seized up on

me yet, I have gotten a few messages saying relay closed should be open. so far it has not fused. Krassy said they had gotten a bad batch of relays, but I believe the switching
> mechanism needs a protection circuit which only allows rf when the rig is ready. By the way, Dick, my rig is also brand new. Only a month old. I am hopeful that the software will possibly resolve this problem. I will never use UPS again (Krassy gave me a new amp free) and I don't recomment u send it back. U sound like u can solder the relay in yourself.

One of two 2000A amplifiers purchased in December, 2000
experienced this very same failure. Transceiver is FT-1000MP.
Control signal to 2000A is via the sequenced signal available on
the Band Data jack. Full QSK is NOT used. Relay failed within 2
days of periodic use.

Krassy sent a new Kilovac HC-1 relay which was installed in about
an hour without problems. This amplifier has not exhibited the error
message since, and was used intensely in the recent ARRL DX
CW contest in M/2 mode at N3RS without any problems at all. We
assume that the original relay was defective, since we did NOT hot
switch anything at all.

As an aside, Krassy said that a Jennings RJ1A would be a suitable
replacement. Per Krassy, Acom thoroughly investigated both the
RJ1A and HC1 before deciding upon the HC1, which they
considered a better relay for this application. We decided to install
the replacement HC1 based upon Krassy's recommendation and
willingness to send us a new one quickly. You should check first
with Krassy before replacing the HC1 with an RJ1A to make sure
that the warranty on the amp is not affected by this change.

By the way, we feel that the two 2000As in use at N3RS made a
significant contribution in our effort, where we have a claimed 3rd
place finish.

When I was investigating T/R relays for the Titan amp, it appeared that the nominal specs for the HC-1 relay had it operate a few milliseconds sooner than comparable Jennings series relays. I don't know if the ACOM has any circuitry to "hot shot" the relay into faster operation. The Titan amp apparently did.

My point about doing the correct timing and avoiding the use inhibit line is as follows:

If you are depending upon the inhibit line to avoid hot switching you have introduced additional failure mechanisms.

1) Proper and timely generation of the inhibit line signal within the ACOM
2) Proper and timely use of the inhibit signal line by the exciter. There appear different voltage levels/polarity requirements for different rigs for the "inhibit" signal.

The failure or spastic operation of either may cause hot switching problems.

Of course your choice, your risk. If I had a rig which could utilize the inhibit signal I'd both get the timing right and use the inhibit line.

It would be useful to know the ACOM's nominal T/R switching time.

Tnx dave for the information. The 3rd switch has not failed yet, but I hav gotten the error message. Here is hoping I will have no other problems. Other than this one problem, the amp is superlative. Best on the market. also, Krassy sticks behind his equipment 100%. I do believe though some type of protective circuit needs to be built into the amp. Mel.

409. What a great company! (was Re: Acom transmit/relay switch)

Yahoo group: acom-list (1999 — 2009)
Date: 2001-02-25 02:38:46 UTC
From: dick.green@valley.net
Topic: 401 Message: 409

Last night I sent an email to Krassy about the relay failure. This morning I received a reply from Vassil Vassilev, LZ1JK, President of ACOM. He replied because Krassy is on his way to Bulgaria for several days. Vassil apologized for the failure and said Krassy would send me an HC-1 when he returned. He also told me that I could replace the defective relay with a Jennings RJ1A without voiding my warranty, and provided complete and detailed instructions for doing so. Finally, he provided information about how the QSK circuit works and instructions for checking it with a scope (WARNING -- operating the amp with the cover off is dangerous!)

As I just happened to have a spare RJ1A left over from adding QSK to an SB-220 (for some reason I thought I needed a backup), I replaced the relay this afternoon and the amp works fine now. I don't know about you guys, but this kind of response and service is very impressive. It's not often that a company will let you do a repair like that without voiding the warranty, and it's less often that they will tell you exactly how to do it and how the circuitry works. Even less likely, of course, is that the President of the company will handle the matter. I'm sure that doesn't happen every day, but it shows that they care about customer service at ACOM.

Below I've included Vassil's description of the QSK circuit and timing. As you can see, there's an accelerator circuit and the controller waits 5ms before grounding KEY OUT. I think that could be a little short, even for an accelerated vaccum relay. However, Vassil also says that the relay contacts are monitored for improper sequencing and it isn't possible for the contacts to be damaged by hot switching. I'm not sure I understand exactly how this works, though. I have not attempted items a) and b) in the QSK timing check-out because it involves operating with the cover off and interlocks defeated (that always spooks me and I only do it when absolutely necessary.) I did check item c) and it's OK.

Brian's comments about the MP bother me. Could it be that the TX INH circuit doesn't work properly? I guess the 1000D must have exactly the same circuit because that's the rig that destroyed Mel's relays! Also note that the FT-990 has the same TX INH feature, so it's hard to understand why the introduction of the MP caused so much relay destruction.

I do like Brian's advice of not relying entirely on TX INH, especially because it's so easy to dial up the MP delay time (menu item 7-4.) I tried 10ms and you would be hard pressed to tell the difference on the scope, much less on the air. I think this is an appropriate delay, especially given that the Jennings RJ1A probably

doesn't switch quite as fast as the Kilovac HC-1. But here's an interesting question: when you enable TX INH by pushing in the Band Data plug, does the MP ignore the delay in menu item 7-4, or add it anyway? I haven't been able to find anything about that in the MP Technical Supplement. Guess I'll have to check it on the scope. I'm not going to use TX INH until I know.

Here's Vassil's description of the ACOM 2000A QSK:

Some comments about T/R system in ACOM2000A were provocated by your e-mail.

The relays normally actuate for 2-3 milliseconds (incl. bounces) since an accelerating R-C network is put in series to a +48VDC supply. The controller monitors the n.o. contact and lets it 5 milliseconds to actuate or to release after a command. You don't need additional time after the controller has enabled transmitting (several additional milliseconds does not harm but RX periods between CW signs are unnecessarily shortened).

The TH INH connection is not critical for the system since the controller monitors the RF presence on the relay contacts. A lot of transceiver models have no suitable input but they work flawlessly with ACOM2000A in QSK mode. That is to say the bad cable in the beginning should not be a reason to destroy the relay. Anyway, you are in a better position with YAESU1000MP since its TH INH works great and you should get better reliability in critical situations. Unfortunately, this cannot help a bad relay, some relays latch even after have been tested.

The QSK controller would not miss any improper relay performance: it monitors the ralays contacts for every dot and dash, and while they last too. If a problem is detected, the QSK controller not only disables the KEY-OUT signal, but also cuts off the tubes BIAS voltage even before signalling the CPU, RCU and the operator. It would not issue any switch-over command to the relay while RF is present at the antenna output. This way, no "hot" switching is allowed, at least until the system is in order. We have no faults registered in the QSK control system until now. Anyway, I'll describe how to check it.

a) You may check the *OUTT/R signal synchronously with the RF output using a two-channel oscilloscope. Find *OUTT/R on JP1:8 (or soldering point K1B) of the wattmeter PCB. This is the relay coil conrol. Be careful about the oscilloscope input: DC high-level is +48V and up to 100V overshoots appear at each end of transmission. The control signal must become low (nearly half the voltage) for at least 5ms before the RF appears, for every CW dot or dash. It must last another several milli-seconds after each RF disappearing. In fact, the low-level voltage becomes nearly zero for 1-2ms at each dot beginning, then arises to about half the supply since the relay movement is accelerated by R5-C6 group in the INTERFACE PCB.

b) Check also the *ORC signal in the same way. Find it on JP1:5 of the wattmeter PCB again. This signal monitors whether the relay's "com" contact is closed to the "n.o."; it is low (several mV) when closed and high (about 2V) when open. Similarly to the coil control signal, at least 1ms timing margins must be observed at both dot-ends, in respect to the RF output.

c) Turn to a manual keyer. Pull off the KEY-OUT connector (if used) and short-circuit it in order to enable transceiver regardless the amplifier's control. Key down the transceiver and pull off the KEY-IN connector while transmitting: the amplifier should not switch-over to RX, until RF is present. Stop driving: the amplifier should switch to RX.

Please inform me about the results or contact ACOM again if you need any help or additional technical information.

Like I said, great company (and a great amp.)

73, Dick WC1M

410. 1000MP/2000A QSK timing

Yahoo group: acom-list (1999 — 2009)
Date: 2001-02-26 08:27:10 UTC
From: dick.green@valley.net
Topic: 410 Message: 410

I hooked up the dual-trace scope to the 1000MP/2000A tonight and checked out the QSK timing. Here are the results:

1. On Key Down, the MP immediately grounds TX GND (pin 2 on Band Data.)

2. When KEY IN is grounded the ACOM delays 2.5ms, then grounds KEY OUT.

3. When the MP's TX INH (pin 8 on Band Data) is grounded, RF begins after the amount of time programmed in menu item 7-4. However, the MP imposes a minimum delay of 7.5ms (i.e., if 7-4 is set anywhere from 0 to 7ms, the delay is 7.5ms; if 7-4 is set above 7ms, the delay is whatever 7-4 is set to.)

4. On Key Up, RF stops after the delay in 7-4 plus 5ms; TX GND is raised after the delay in 7-4 plus 10ms; the ACOM raises KEY OUT when TX GND is raised.

As you can see, the ACOM delays only 2.5ms, not 5ms. However, with the ACOM's 2.5ms delay plus the MP's minimum 7.5ms delay, the minimum delay between the MP's T/R signal and RF output is 10ms. This should be more than adequate for the vacuum relay to switch, no matter how MP menu item 7-4 is set.

If TX INH is disabled, the delay between TX GND and RF output is as follows:

A. If 7-4 is set from 0-7ms: 10ms

B. If 7-4 is 8 or higher: the programmed delay plus 4ms

It seems to me that the best setting for 7-4 is 5ms, which is the factory default. This will result in a minimum delay of 10ms and should be more than adequate for all modern vacuum relay amps. The old open frame relay amps will require more time.

My conclusion is that even though the ACOM delay is not as long as Vassil said, the relay could not have hotswitched because of the delay imposed by the MP. That leads me to believe that my problem really was caused by a defective relay or by some sort of magnetic field problem or logic problem in the ACOM. With the new Jennings relay in there, time will tell. So far, no T/R faults.

BTW, I saw no RFI-induced problems on the signal lines on any band.

73, Dick WC1M

411. Re: [acom-list] 1000MP/2000A QSK timing

Yahoo group: acom-list (1999 — 2009)

Topic: 410 Message: 411

Dick this is interesting information.

I am still not sure how it determines how long it takes for the T/R relay to close. Per chance, did you look at how long after key closure, the amps RF took to be produced.

The alternate route of keying this is not to have the ACOM key the rig. Instead key the rig and have the rig's T/R signal key the ACOM. This is the usual configuration guys have used for ages. It is what I use here. The timing for this configuration is critical.

By the way, there was one note in the ACOM archives from a German station who had the vacuum relay stick and had to replace it after about 300 hours.

The specs on these relays don't really address RF switching capabilities. They rate the contacts for DC or near DC. It is usual to derate these specs by a huge amount for use at HF. If one does this exercise, one shouldn't be using these relays for more than an amp or so. The TITAN amps (despite all the sequencing and protection circuits) had many reports of failures. In fact, I had bought a spare HC1 just in case. So, I suspect as the ACOM's get more use and their numbers grow, so will the relay failures.

Thanks for the info.

dick.green@... writes:

<< I hooked up the dual-trace scope to the 1000MP/2000A tonight and
checked out the QSK timing. Here are the results: >>

Good information - Thank you for sharing it with us --

My 2000A is working flawlessly since the day it arrived last summer. (SN 116).

My Mark V and Omni VI both recently died and are back at the "factory" for
repair!
In the meantime, I starting using a FT-990 yesterday.

I am using the FT990 pin 3/4 remote output (not using the FT990 internal
relay) to key the Acom Amplifier - all appears well -- I have operated SSB &
CW and short bursts of QSK.

I have over 2000 RTTY Q's driving the Acom at legal output with the Omni-VI
--- again no problems to report. The Omni does require the Txin/Txout lines
to be jumpered and the Y output connected to the Acom Tx-in RCA connector.
The Acom Tx out is not used in this case -- The Acom TR switch does get quite
a work out running CW with this configuration as the TR switches between each
dit and dot (full QSK), even though the Omni is not in the QSK mode.

I use the Mark V FT-1000MP Tx relay output connected to the Acom -- I have
never seen any Acom faults with this configuration.

Brian,

My interpretation of Vassil's email is that the 2000A uses a fixed delay of 5ms. In other words, it assumes that is how long the vacuum relay takes to close. I measured the actual delay as 2.5ms.

I did measure the time between key closure and RF output from the amp. The minimum delay was 10ms -- 2.5ms for the ACOM's delay and 7.5ms for the MP's minumum delay. That's if the delay programmed into the MP is between 0-7ms. Above 7ms, the 7-4 delay is added to the ACOM's delay.

Aall my RF monitoring was at the amp output. Perhaps I should have monitored the MP output instead, but I assumed that once the relay is closed and the cathode bias is switched, the amp's RF output would follow the input virtually instantaneously -- I probably couldn't measure the interval!

The standard hookup you describe works fine with the MP/ACOM because when the inhibit line isn't used, the MP imposes a minimum delay of 10ms between key down and RF.

Those HC-1 and RJ1A relays are used in all the QSK amps I've seen (except the Alphas with their PIN diodes.) I'm sure you're right that the relays probably aren't up to the job. Also, duty cycle probably isn't up to using QSK in a contest -- you'd probably have to replace the relay in a couple of years!

Bill,

The FT-990 T/R sequencing is the worst I've seen. For some unknown reason, this rig delays 7.5ms between key down and grounding the TX GND lead on the Band Data jack. After that, there is only a 2.5ms delay between the TX GND signal and RF output. That's cutting it very close for the ACOM's vacuum relay, with a lot of risk of hotswitching. The trouble with hotswitching is that you can't tell it has been happening until it is too late.

I wouldn't use QSK in this configuration if I were you. Besides, the FT-990 QSK is also among the worst, as revealed by the scope pictures in the original QST review (and I've confirmed them here.) The elements are severely shortened in QSK mode.

Otherwise, I'm quite fond of the 990.

N3RS just reported to me that he has had an unrecoverable failure of his December, 2000 vintage 2000A:

"Motor voltage too high"

Results in a soft fault each time transmitting is attempted, making the amplifier totally disfunctional.

Has anyone seen this failure?

Is there a "home cure" for it, or does the amp have to go back to Krassy?

Right in the middle of the ARRL SSB, too. Ugh.

Dave N3RD

Dave,
The book says to check the line voltage and the voltage selector.
Barry
P.S. At least it's not CW weekend!

Hi Barry. I believe Sig N3RS has already checked into these settings, but I could be wrong. But what would cause that to change? We have been using the amp with these settings for some time now, with no apparent problems....until now.

Could the line voltage setting get changed "on the fly" somehow?

Dave

419. Antenna switching

Yahoo group: acom-list (1999 — 2009)
Date: 2001-03-04 18:44:46 UTC
From: Brian, N8WRL
Topic: 419 Message: 419

Hi all! Pardon the long message...

My 990 is in the shop so I was hunting band-countries with my FT817 (QRP rig) and the ACOM. All in all it wasn't too bad but I ran into something weird with the antenna switching.

I have five beams covering various bands and I've programmed the 2000A to tune up properly on each of them for the bands they cover (and _only_ the bands they cover).

The 2000A remembers the last antenna in use for each band segment. That's cool except for two situations I ran into:

1. I have two 10-15-20 tribanders. One rotates and the other is fixed on EU. Suppose I was operating on the rotatable beam (Ant #5) to Asia or something for a while. I move to 40m (#3) for a run and see a European I want to work on the cluster. I tune to the spot, switch the antenna to the EU tribander (#4) and give him a call. The 2000A remembers I was last using #5 on this band and switches to that antenna!

It seems like my selection should override the 'memory' if the antenna selected is 'ok' for that band?

2. I've had some trouble getting used to operating split on the 817 so I transmitted on 40m when I meant 20m using one of the tribanders (good thing it was QRP!). Here's the sequence:
Operate split on 40 (ant 3)
Move to 20m - forget to turn off split
Select a tribander (4 or 5)
Xmit again - amp goes back to #3 (that's right but I'm too dumb to notice the split)
I select the tribander _again_ and it 'sticks' this time
Xmit again and notice HI SWR because amp is trying to xmit 40 on a tribander.
I notice the problem and turn off split and stick with the tribander
All is well now
Trouble is, the _next_ time I go back to use 40m (legitimately, this time :)) it selects the _tribander_ as the antenna!

In this case, it seems like the amp should realize I haven't programmed _any_ 40m segments for this antenna and refuse to xmit there? Let alone remember that as the last 40m antenna...

Note I haven't tried any of this by changing the antenna from the amp's control panel - only the 2000S switch controller. Would that make a difference?

Does this make any sense? It will be great when the software becomes available and I can work that into my logging programs.

73!

Brian,

You have touched on a gripe of mine with the ACOM.

One needs something like an A/B or A/B/C switch to handle different antennas for the same band/segment. I looked into implementing this via the network but he network and control language is such a mess. I was never successful in getting control of the antenna switching in the ACOM via the RS232. I have 3 antennas on some bands and 2 antennas on others. It would seem to be a simple matter to provide the ACOM appropriate voltages from the switching circuitry to have it also follow the antenna changes.

It is interesting that the programmer for the ACOM control program is almost a year behind schedule. I suspect he ran into some of the same communications programming difficulties I did.

I also think 10 antennas per segment is too many. I would rather have more segments -- especially on the 15 and 10 meter bands. My antennas are tuned for the CW band and the SWR changes fast as one goes up. The segments are simply too wide.

I have had no luck at all getting a "hearing" on these items. It seems that the antenna stuff is so embedded in the program that changes are unlikely.

Hi Brian!

Thanks for the quick reply.

I sent an email today about getting a copy of the technical reference - there are several mentions of it in the docs and I wonder if it has any of the serial comms info. I'd like to take a stab at programming it myself.

I have a couple of goals:

Given knowledge of what bands antennas cover, what masts they're on, and where those 'masts' are pointed (rotor info) selecting a packet spot to work should do these things:

1. Select an antenna that is close in bearing (rotatable vs. fixed, etc.)
2. Turn a beam if necessary (beamwidth data)
3. Tune the rig the spot freq
4. Set any split data (QSX if available)
5. Tell the amp about our choice so it can tune the segment
6. Tell the switch about our choice (probably part of 5)

So far I have 1-3 and part of 4. I was hoping I could get 5,6 with Gerry's software.

Gee Norman just who are you going to ship your Alpha 89 to when (not if) it dies? The present company who took over Alpha has zero track record in the repairs department.

At least ACOM repairs them quickly.

Norm,
When you set up the amp, you have to enter YCCC as password
to get it to work on contest weekends :.)

From: ea5by@lynxdxg.com
Topic: 425 Message: 425

In my opinion, ACOM has one of the best, if not the best, services I ever seen. Even here in Spain.
Worked all the major contest with my serial number #2, and worked flawlesly.
Keep'on ACOM!

426. Leaving main power switch on

Yahoo group: acom-list (1999 — 2009)
Date: 2001-03-10 06:12:21 UTC
From: dick.green@valley.net
Topic: 426 Message: 426

The 2000A manual advises that after the amp is shutdown from the RCU, the main power switch should be powered off if the amp won't be used for more than about 30 minutes. Following this rule is a little awkward for me, since my amp is on the floor several feet from the operating desk and the power-on LED isn't visible to remind me to shut off the main switch.

Does anyone know what parts of the amp are powered on when the main switch is on? What's the problem with leaving them powered up all the time? It sure would be a lot more convenient if I could just reach over and turn on the amp from the RCU.

BTW, the 87A CPU is powered up all the time so that the amp can be controlled remotely from the RS232 port. When a power-on command is received via RS232 or the front panel, the CPU activates a set of relays to energize the HV board. I would have thought the 2000A did the same thing (at least, that's what it sounds like.) Is the 2000A designed to be operated remotely via RS232 like the 87A? If so, it would be necessary to leave the main power switch on all the time.

Thoughts on this would be appreciated.

73, Dick WC1M

I hope you don't have to turn off the main power switch. My amp is in the basement. I only turn off the switch when I am going to be out of town for a week or more. I just turn off the amp from the RCU in the shack. Interested in any feedback, like Dick is, on this subject.
Tony

431. Good news on main power switch

Yahoo group: acom-list (1999 — 2009)
Date: 2001-03-12 23:55:53 UTC
From: dick.green@valley.net
Topic: 431 Message: 431

Folks,

Vasco at ACOM sent this reply to my inquiry about leaving the main power switch on all the time:

"There is not a technical problem for 2000A to work all the time with the RCU powered (on duty). The recommendation in the manual is not related to any special regime of the parts inside the amplifier but is a general safety recommendation.

Only the RCU microprocessor system is live at that time and its consumption is less than 0.5 Watts. Also, the LV rectifiers for +/- 12V, +24V, +48V, and -125V are powered, but there is no consumption there until you press the red ON/OFF button on the RCU. The HV transformer primary, High Voltage, Screen Grids Voltage, Motors Voltage, and Heaters Voltage are off.

The CPU (the microprocessor system inside the main unit) is not powered at that time, so you cannot turn ON the amplifier via a command via the serial port. It is necessary to make an additional connection to remotely power ON the CPU. This is described in the technical CD.

On the whole, it is safe for the amplifier to leave the main power switch ON all the time."

Best 73! Vasco, LZ1JK Sofia, 12 March 2001

Hi:

I leave mine on all the time as I run the amp via remote control I then use a control signal (12V) from my Kachina 505arx rotor control to turn a 12v relay on for about 2 seconds which in turn shorts out a pair of pins on the serial port of the amp which powers it up.

Works very well, along with Gerry's, W1VE, software so I can monitor the amp via PCAnywhere or Radmin.

From: k2at@home.com
Topic: 435 Message: 435

I can get the auto antenna switch to switch to the right antenna as long as the db9 from the acom 2000s is connected to the acom amp. The problem though in connecting it to the amp is when running barefoot without amp, I must manually change antenna settings. Has anyone figured out how to connect the antenna switch to the Yaesu FT1000D so that the switch reads the frequency off of the Yaesu and then switches to the appropriate antenna. I am hoping that perhaps the Band data switch on the Yaesu might be the answer. Help!!

As I understand it, it is the _amp_ sensing the freq and telling the switch
to change - the switch itself doesn't do that. Come to think of it, that
might
be a neat BASICstamp or PIC project - interface with the band data port
and send the right ant change command to the switch...

437. ACOM switch

Yahoo group: acom-list (1999 — 2009)
Date: 2001-04-02 03:53:23 UTC
From: alsopb
Topic: 437 Message: 437

Mel,

Upon reading what you said again, I concluded you have ACOM's ant switch.

It turns out that the ACOM switch uses the same BCD code as the "band data" outputs of many rigs and computer programs.

Perhaps you can directly drive the antenna switch and bypass the amp from the circuit. Then set amp to antenna 1 for all bands. It might be a good idea to isolate your rig from the switch via relays or optoisolators.

Krasy can supply you with the switch info.

I have a copy of it. It shows wiring of the connector which plugs into the back of the switch box and switch. It appears to be a simple matter of connection your external BCD source to pins 4,5,6 and 7 and leaving pin 1 (+24 volts) and pin 3 (ground) connected. You may have to hardwire pin 2 (the READY) signal high to enable it.

440. Website & 2R box?

Yahoo group: acom-list (1999 — 2009)
Date: 2001-04-29 16:39:29 UTC
From: Brian, N8WRL
Topic: 440 Message: 440

Hi all!

The reflector has been kind of quiet lately...

Three things:

1. Anyone notice what appears to be a DNS snafu? www.hfpower.com
goes to YCCC!

2. I still haven't heard much about this 'SO2R' amp-sharing box I think
ACOM is working on or already has. Haven't seem anything on their
website (back when it actually went to ACOM :). Top-Ten and WX0B
both have SO2R boxes but they don't handle the connection to the amp
or the xmit control lines.

3. And lastly, any news from Gerry on the software?

Thanks and 73!

-Brian n8wrl

PS anyone going to Dayton? Any kind of ACOM gathering planned?

This would be nice. I actually designed one myself and I plan to build it as soon as my travel schedule lightens up at the end of May. If Acom has one in the works, I'd rather buy than build.

> 3. And lastly, any news from Gerry on the software?

I'm interested too. Not that I have the time to fool with it right now, sigh!

BTW: My dilemma with the IC-775 spike problem has been solved (TNX N2TK & K3WW!!). I'll write up the story when time permits.

I'd sure be interested in what you came up with. Any interest in sharing? :)

> BTW: My dilemma with the IC-775 spike problem has been solved (TNX N2TK &
> K3WW!!). I'll write up the story when time permits.

I had what I thought was a similar problem with my FT100D, but I think now
that is wasn't a spike but a spur - too long to go into, but I think the
100D had
a pretty strong out-of-band spur that confused the amp.

444. Antenna switching problem - continued

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-05 21:38:03 UTC
From: Brian, N8WRL
Topic: 444 Message: 444

A while back I posted a question about automatic antenna switching when the amp tunes up as a result of a frequency change.

I'm really hoping I'm doing something wrong, but for the life of me I can't figure out what it is. The amp seems to change the antenna to the most recent one used, regardless of the frequency I'm on. Here's a scenario:

* Operating on 17m which is antenna #1.

* Using the switch or the amp's control panel, change to antenna 5 (tribander). Both the amp and the switch say '5'.

* Tune the radio to a 15m frequency and listen. The amp says antenna 5 but it still has the 17m segment displayed.

* Xmit a dit - the amp tunes to the right 15m segment but the antenna goes back to #1!

I carefully went thru all the antennas, using the auto-tune menu tuning them up for the bands they work on and making sure the antenna numbers are right. I do have two antennas that work on the same bands, so I might expect some confusion if I worked on #4 and then switched to #5 - it makes sense that it would try to go back to 4. But to an antenna it was never tuned for in that band??

I'm getting to the point where I'm thinking about giving up on the auto antenna switching. Either turn off the auto-switching menu or disconnect the switch from the amp and do it manually. Seems a major waste...

Any ideas??

-Brian n8wrl

445. Re: [acom-list] Antenna switching problem - continued

One thought I had after sending this - as I was tuning the antennas I did not turn off the automatic antenna switching - when tuning, the amp would go back to the previous antenna and I had to reset it to the one I was tuning. Once there, tuning went fine. Could that have messed up the memory? I guess I should clear all the settings and tune again to find out...

Brian, I have a different problem, but just as frustrating. I am using the ft1000D and the acom antenna switch. If I try to connect the DB9 from the auto antenna selector to the DB9 on the acom and I turn on the amp, I get "Microprocessor conflict" and the amp shuts down. Krassy said to get a null modem DB9 cable instead of straight thru cable so I bought a null modem adapter and connected to the cable. Alas, still get microprocessor conflict and amp shuts down. If I use the antenna selector switch manually and remove the DB9 cable, I can operate the antennas manually. However, if I connect the DB9 cable, I get the conflict error message. Any ideas??

One thought I had after sending this - as I was tuning the antennas I did not turn off the automatic antenna switching - when tuning, the amp would go back to the previous antenna and I had to reset it to the one I was tuning. Once there, tuning went fine. Could that have messed up the memory? I guess I should clear all the settings and tune again to find out...

HI Mel!

Well that isn't the problem I'm having, but I do have an idea. First, my antenna switch came with the cable that goes to the amp - did yours? Seems like if it didn't, ACOM could get you one. That way there'd be no guessing about what kind ot use.

Second, I notice from the manuals that they amp and the switch form a network of sorts when they're connected - you can create a 'daisy-chain' of serial connections so that they can all communicate. They have an 'address' so one unit can address commands to another. I seem to recall that the amp and its switch had to have 'matching' addresses. The switch address is set via some internal jumper (I think - never changed mine) but the amp's address is set via one of the 'def' menu options. Maybe there is some sort of address conflict?

Does it matter what order you turn things on? If the amp goes on first, what happens when you turn the switch on? Vice-versa? What about some other sort of cabling problem, like a ground loop or something?

-Brian n8wrl

****

****
My ACOM switch has the control wire connected to it, that is all -- The
switch is on the floor in the shack. The switch does change to the memorized
positions for each band, once I transmit on the new band. I head it is best
to try and remember to turn the Antenna Switch Control ON before you power up
the Amplifier.

What I don't like:

1. Having to transmit with Amp ON, to change the switch to a new band
2. The single digit (1-0) display on the Control Unit.
3. Having the power supply inside the Control Unit.-- much heat generated -
4. HUM - The control unit makes more noise than my Mark V Power Supply!
5. Promises of control software being available soon, not kept.

In the meantime, I am using a manually controlled antenna switch made by
I.C.E.

Is there any truth that ACOM is making a new control unit that has an
alphanumeric display?

I heard that Krassy is off working "other projects" and does not even have
time for Dayton this year??

Has anyone used the MP band data to control the ACOM Antenna Switch??

Hi Bill,

A number of us have kicked around interfacing the antenna switch directly to band data input.

It can be done, I believe. However, it would require that you have one separate antenna per band -- unless you modify the switch unit.

Here's how I think it works. The (A)BCD is sent to a decoder in the unit. The output of the decoder is a single on bit for each of ten outputs.
1 = 160, 2 =80 etc.

You could hook it directly to the BCD of the MP by makeing a breakout box. This box goes between the ACOM switch box and the switch. One needs to break lines 4,5,6 and 7 going to the switch and connect them to the MP A,B,C,D pins on the band data output jack. Connect MP ground to pin 3 of the switch connector. You can test this before hooking up to the MP by just shorting the data pins to ground one at a time. Shorting pin 4 gets you the 160M antenna position, 5 to ground gets you the 80 M antenna position etc.

However, I have been using a HB switch box for years based upon the exact same principles. Originally it was hooked to computer LPT output. I fried several LPT ports (reason unknown). I finally reasoned some kind of transients (Lightning nearby?) was getting into the leads somehow. I isolated the LPT port from the switch box via a 4PST relay which closes when power to the station is on. No failure since and I hope it still is appropriate isolation for the MP band data. Perhaps you would want to build an opto isolator.

The amp is always using antenna 1 in this hookup.

The more usual case might be where one has an antenna or two which operate on multiple bands. Now one has to either rewire the switch unit using diodes to switch the "tribander" relay only when a 1 signal appears on lines 20, 15 or 10. An alternate way would be to build hardware logic which translates the MP BCD data to pseudo BCD data which selects the correct antenna for each band. A BASIC stamp would be an easy way to do this. One might be able to build a diode matrix.

Since I haven't done this with the ACOM switch unit, I don't know for sure it will work. I do use the MP band data to drive the 4028 decoder and a HB switch box. I understand the same decoder in used in the ACOM switch. There is some note in the switch documentation that indicates some switches may have high as an on state. You can figure this out with some clip leads and the breakout box.

I agree something more practical needs to be done with the ACOM amp
and switch box arrangement to reflect what real stations use.

I'm not sure I understand - what else would be connected to the switch (tx-in/out?) I assume you do have multiple antennas to switch...

> What I don't like:
>
> 1. Having to transmit with Amp ON, to change the switch to a new band

K3KO's ideas might help here. I do almost all of my operating with the computer on so I'm thinking about controlling it all from there.

> 2. The single digit (1-0) display on the Control Unit.

The switch has ten positions, so 0-9 makes sense to me. I haven't heard the alpha-display rumor - are you thinking there will be some way to have alpha tags for your antennas instead of just #'s? That would be neat.

> 3. Having the power supply inside the Control Unit.-- much heat
generated -
> 4. HUM - The control unit makes more noise than my Mark V Power Supply!

I agree on both - also, you don't want the control unit is too close to your monitor.

> 5. Promises of control software being available soon, not kept.

I'm guessing there are development complications here. K3KO and I have corresponded about serial interfaces to the ACOM gear and it sounds non-trivial. An update would be welcome, though...

> In the meantime, I am using a manually controlled antenna switch made by
> I.C.E.

Now I'm really confused about your use of the switch on the floor - why is it hooked up at all?

Hi to All,

Isn't it possible to auto change antenna's with log software for the switch? I'm using Logic 5.3 and this software readout the frequency from my FT1000D. Maybe it can controll the switch?

Hello,

I just got off the telephone with Krassy. Even though he is very busy on commercial products, he pledges continued first class support for the Amateur Radio community. He does listen to our recommendations and is always looking for ways to improve the ACOM product line.

1. ACOM 2000A Control Software: The are a couple of "bugs" in the control software that must to be solved prior to release.

2. ACOM is working on a new Control Unit for the 2000SW. The new Control Unit is to be used with the 2000SW without the 2000A Amplifier It is not a replacement for the existing 2000S.

3. Regretfully, Krassy will not be able to attend the Dayton Hamvention this year due to high priority business commitments. This is not to be taken as less interest in the Amateur Radio community.

Again, I would like to reiterate that I feel that the ACOM 2000A Linear Amplifier is the best amplifier available today. It looks as good inside as it does on the outside. Both the Amplifier and Switch look like Mil Spec equipment.

I have had my 2000A Linear Amplifier for almost a year now. The big test was in January. when I ran it at 1500 watts out in the ARRL RTTY Roundup. It ran flawlessly and quiet.

Well, now I can't seem to turn automatic antenna switching back ON! Here's what I did.

* Clear all 'usr' settings.
* Set 'auto-antenna switching' to off
* Re-tune all the antennas like this:
Using amp's keypad, switch to the right antenna #
Using amp's keypad, switch to the right segment
Tune rig to the middle of that segment
Press Auto-tune
Apply power until it says its happy
Amp stays at the right antenna and tuning is set.

Then I turned antenna switching back on (kind of annoying you have to turn amp 'off' to get to that menu...') and tried some tests.

Even after cycling the power on the amp, it does not auto-change antennas any more! Whatever antenna is selected, and whatever freq the rig is set to, applying power leaves the antenna in place and the amp tries to xmit. If it happens to be the right antenna, it selects the segment with the 'usr' and all is well. Otherwise, the segment will be 'def' and I may get a fault if the load is terrible.

So maybe I got what I wanted.... :(

Any ideas?

-Brian n8wrl

Yet another followup (unless there's more interest this will be the last one - sorry if this is a waste of bandwidth).

It seems it _is_ switching antennas - it seems to have to be 'trained'. If it goes to the wrong antenna, switch it to the right antenna and xmit again. Bop around bands and set the antenna to what you want if it 'guesses' wrong. Repeat for all the segments on a band. After a while of doing this it seemed to be be making the right choices.

I'm still not sure exactly what the logic is.

Cannot help u with your problem, but perhaps u can help me. I have the 1000d and acom antenna selector and switch. When I use the antenna selector manually, I can change to any antenna I wish. But, if I connect the DB9 to the amp and to the acom 2000s, I get a microprocessor conflict and amp shuts down. If I just connect the DB9 to only the back of the amp and not even connect the other db9 to anything, I still get a microprocessor conflict message. This is crazy. What am I not doing. Ur help would be appreciated. Mel.

Brian, it is not a matter of the amp selecting the wrong antenna, but rather if I hook up the DB9's to the amp and switch I get a microprocessor conflict error when I turn the system on. It then proceeds to turn the amp off. This morning I hooked up the DB9 to just the amp and left the other end unconnected and still got a microprocessor error. If I use the 2000s selector manually everything ok. Amp turns on and I can switch to any antenna I wish. Any thoughts before I throw this switch out the window. Mel.

It sure sounds like there's something wrong with that cable.

If it's not connected to anything - what else could the problem be ?

Get a real null modem cable - not an adapter.

> Brian, it is not a matter of the amp selecting the wrong antenna, but
rather if I hook up the DB9's to the amp and switch I get a microprocessor
conflict error when I turn the system on. It then proceeds to turn the amp
off. This morning I hooked up the DB9 to just the amp and left the other
end unconnected and still got a microprocessor error. If I use the 2000s
selector manually everything ok. Amp turns on and I can switch to any
antenna I wish. Any thoughts before I throw this switch out the window.

That sure sounds like a cable problem to me - a short in the cable? Try another.

459. Re: From ACOM -Antenna switching problem - continued

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-07 19:07:40 UTC
From: aa1nd@aol.com
Topic: 459 Message: 459

Dear Brian,

Here is a detailed instruction about the sequence of powering ON/OFF the selector and the amplifier. Obey rules 5(a)...5(d) below when using the amplifier plus antenna selector. Rules 5(e)...5(f) are about how to define which antenna to be used for different bands.

Before proceeding with instructions below, please check the following:

1. Always use to apply mains power to the antenna selector the first and to switch it off the last.

2. Check whether the "AUTO ANTENNA CHANGE" option is ON. See p.6 below.

3. Check the installation of the RS232 serial interface cable between the antenna selector and the amplifier. This cable must be a "null modem" type with two DB9F connectors (female 9-pin, with pins 2 and 3 cross-connected). It must be connected between antenna selector's connector marked "AMP" and amplifier's connector marked "RS232 INTERFACE". See pages 7-8 of the selector's Operating Manual for details.

4. Check the slide switch located on the rear panel of the antenna selector. Move it several times left-right in order to improve its contacts, then set it to point to the "AMP" (where the interface cable connects to the amplifier).
---

5. When you begin working:

a) all antennas are grounded when the selector is OFF. To use any antenna you must turn ON the antenna selector - see (b).

Never turn ON the amplifier before the antenna selector. If you have missed this, the automatic antenna change might be confused. Anyway, if you missed, or note any improper control, just move the slide switch (located on the rear panel of the antenna selector), then return the slide switch to the amplifier's DB9 control connector and wait about 5 seconds. This will correct the control at any time.

b) turn ON the antenna selector - number "1" must begin blinking on its LED indicator. In this state you may use the transceiver barefoot (with amplifier off). Only manual antenna change is possible in this situation (from UP and DOWN buttons of the selector). To use automatic antenna change you must turn ON the amplifier - see (c);

c) turn ON the amplifier and wait 150 seconds. Please don't change antennas while the amplifier is warming-up. You may still use the transceiver barefoot during this period;

d) when the amplifier is ready (after a CW "R"), the number "1" must freeze (stop blinking) on the selector LED indicator. Now go to OPERATE from OPR/STB button on the RCU;

e) select the working frequency from the transceiver (for instance 14050kHz). Make a short transmission: the amplifier will change as needed the band-switch and capacitors settings automatically; The indication on RCU LCD must correspond to the transmitted frequency. The antenna number will be nr.1 if you have never changed it before (or it will change to the number that you have used last time for this frequency segment).

f) select the needed antenna number manually. The number must correspond to the RF output connector of the remote antenna switch. An antenna with good VSWR for this frequency must be connected there.

NOTE:
====
Antenna nr.1 is implied by default for all bands and segments. Using a new frequency segment FOR FIRST TIME, you have to first select the needed antenna MANUALLY if the number is different. In other words, you need to "teach" the amplifier about your band/segment/antenna allocation.

You may use one of the following two ways to select the antenna number:

- from the antenna selector: press UP or DOWN buttons, until needed number appears on the LED indicator; For instance: if currently displayed antenna is nr.1 but you need antenna nr.3: press the upper button twice.

Please note that if you press the button rarely (with 1s or longer pauses), the antenna nr.2 will be first selected for a moment, and then antenna nr.3. If you make two quick clicks, the antenna nr.#3 will be selected directly, without intermediate selecting nr.2. If you need a change from nr.8 to nr.5, press the bottom button 3 times quickly: numbers 7 and 6 will be omited and the selector will jump directly to nr.5.

- you may use the RCU to select antenna numbers if it is more suitable for you: it will be the same as from selector's buttons. Press the left- or right- arrow buttons to decrease or increase the antenna number, then press ENT to select.

Once an antenna has been set for any frequency segment, it is memorized in the nonvolatile memory of the amplifier. Same antenna number must be automatically recalled each time when you return transmitting on any frequency within the same segment.

NOTE:
====
Within each band there are several frequency segments foreseen. You can set different or equal antennas to be memorized for each segment. This means however that you have to "teach" the amplifier for ALL segments, even when they are same for the whole band.

If you set an antenna number for one segment only, it does not become valid for the whole band, but only for the currently used segment. You would have

to set needed antenna for each frequency segment you intend to use within a band.

For instance: if currently displayed antenna is "A1", but you need antenna nr.3, press the right-arrow button. The antenna number on the RCU will change to "a2" (but it is still not actuated). Please note that the capital letter "A" has changed to "a". This means that the command is not yet finished. Press the right-arrow button again: the indication will change to "a3". Now, press the ENT button: the indication will change to capitals - "A3", and the antenna nr.3 will be executed. This must be reflected on both RCU and antenna selector indicators.

g) Make AUTO-TUNE of the amplifier for the selected frequency/antenna combination. This does not concern antenna number memory but its impedance matching. If the indication near the "A3" was "DEF", it will change to "USR" now. If it was "USR", it remains "USR" again (but with new tuning settins). You can refresh antenna impedance matching at any time later.

h) Note the frequency segment as indicated on the RCU (for instance 14000-14100). Select a new frequency on the transceiver, near the center of the next segment (i.e.14150kHz). Repeat steps (f) and (g). Then repeat for 14250kHz and 14325kHz, in order to cover the whole 20m band from 14000 to 14350kHz.

Topics (e)...(h) are discussed again in p.8 below.

i) Repeat steps (e)...(h), for all bands, and all segments inside bands, for all antennas available.

Please note that you have the possibility to use different antennas for different frequency segments in same band. For instance: you may select antenna nr.5 to be used in the segments 3500-3550, 3550-3600, 3600-3650kHz; and antenna nr.6 to be used in 3650-3700, 3700-3750, and 3750-3800kHz. When you transmit later between 3500 and 3650kHz, ant.nr.5 will be selected automatically. Antenna nr.6 will be selected if you transmit between 3650 and 3800kHz.

Note that you can also use same antenna for different bands (suitable for a multi-bander antenna). For instance, antenna nr.3 may be programmed for 20, 15, and 10 meters (or only for a part of any band, or any other combination that would be useful for you).

j) When you intend to finish working, first turn OFF the amplifier. You may use the transceiver now, changing antennas manually (this mode seems to be not suitable for Frank). At this point, you can turn off the transceiver and the selector to finish, or you can turn ON the amplifier again to continue working, if you change your mind.

If you turn ON the amplifier again (now, or next day, or week), all antenna numbers (and the corresponding tuning settings for the amplifier) will be automatically selected with frequency change to those you have used the last time. When you transmit on a new frequency (in OPERATE), the last used

antenna on this frequency segment will be retrieved from the amplifier's nonvolatile memory, and will be selected automatically (as well as amplifier tuning settings). If you make a manual change, this would be memorized as a "last used" antenna for currently used band.

6. This part is about how to check the function selections of the amplifier (if any fuunction does not work as described above). In order to communicate with the selector, the amplifier's address must be selected to "01" and the "AUTO ANTENNA CHANGE" function must be enabled.

Plese check the default selections as described below:

a) Turn ON the mains power switch on the fron panel of the amplifier. The RCU will be only active (with a dark LCD back-lighting). Do not turn ON the red button on the RCU for now. This state is called to be the amplifier's OFF-menu.

Press the ENT button. You will reach the following six sub-menus in OFF state:

HELP [INFO] CLR
CALL LOCK DEF

b) Move the rectangle brackets "[...]" using bottom-arrow button, and then right-arrow button. This will select first [LOCK], then the [DEF] sub-menu between brackets. Now press ENT button again to activate the [DEF] sub-menu.

c) Here you can select step-by-step the following default settings: Mains voltage, Self address, and Auto Antenna Change.

- press ENT - the first default will be displayed:

MAINS VOLTAGE
LOW [NORMAL] HIGH

This setting is not concerned to the antenna selection. Nevertheless, you must go through it.
If [NORMAL] is located in brackets, press ESC to continue. This will not change the NORMAL selection.
(If your mains voltage is normally -5% lower or +5% higher than the selected nominal, you may select [LOW] or [HIGH] at this point, before proceeding. Use left or right arrow buttons to move through selections horizontally, then press ENT to confirm the selection. This may improve amplifier efficiency).

- After pressing either ESC or ENT, the second default selection will appear:

SELF ADDRESS: 01

If the number is "01", press ESC to continue without a change. If there is a different number there, use the left or right arrow buttons to decrease or increase the address number to 01, then press ENT to accept the selection.

- Pressing ESC or ENT will proceed to the last default selection:

AUTO ANTENNA CHANGE
[ON] OFF

If [ON] is selected, press ESC: this will not change the selection. If it is "OFF", use either left or right buttons to select [ON], then press ENT to confirm selection. This will finish the procedure. Now turn ON first the selector, then the amplifier and retry the procedure described above in (1).

This is an instruction how to verify antenna selection:

7. Check whether manual change is possible from the antenna selector, as well as from the RCU of the amplifier:

a) Press the upper button on the selector: antenna number on the selector LED indicator must be increased by 1. Compare if the same number is indicated on the LCD indicator on the RCU.

b) Press the right arrow button on the RCU: antenna number on the LCD indicator on the RCU must be increased by 1 (but with a small letter "a"). Press ENT to confirm selection: the letter "a" must change to capitals "A" and the new antenna must be selected. Compare if the same number is indicated on the LED indicator of the selector.

8. This and the next paragraphs are about the way of programming antenna-to-band correspondence. It describes same issues as (5.e)...(5.h) above in more details.

You have to select manually the needed antenna number when you use a frequency segment for first time (for instance A3 at 14050kHz). The number you select is memorized in the nonvolatile memory of the amplifier. This antenna number will be automatically recalled each time when you transmit on any frequency within the same segment (for instance if you transmit on 14023, or 14099kHz, or any frequency between 14000 and 14100kHz, the antenna nr.3 will be selected automaitcally).

Antenna selection will be the same until you change the antenna number manually again. If you change the antenna manually (while the same segment is active), the new antenna number will be memorized and reproduced in future when you work bettween 14000 and 14100kHz. If you however work higher (for example on 14110kHz), another antenna may be selected. For instance, it might be A1 if you have not pre-programmed the next segment, or it may be A7 if you have used it last time between 14100 and 14200kHz.

You can easily change the memorized antenna number at any time you wish. It's enough to select A3 manually while working on 14110kHz. This will memorize antenna nr.3 for future use also between 14100 and 14200kHz.

9. Please note that within each band there are several frequency segments in the amplifier.

Example: the 80m band is divided in 6 segments by 50kHz each, namely:

3500-3550
3550-3600
3600-3650
3650-3700
3700-3750
3750-3800kHz.

This makes possible to use a single, or several different antennas (if they are narrow-band, or differently directed) over the entire band. Each segment may be pre-programmed with same or with different antennas, as you need. An additional benefit is that not only the antenna, but also the amplifier tuning settings will be automatically changed with frequency within same band.

Please note that if you have pre-programmed only one segment in the band, it will not be valid for the whole band, but only for the segment where you changed. Antenna nr.1 is selected by default for any segment that has never been programmed.

Example:

a) With a new amplifier (or after a memory erase procedure), all antennas are set to nr.1. In the example for 80m:

3500-3550 - A1
3550-3600 - A1
3600-3650 - A1
3650-3700 - A1
3700-3750 - A1
3750-3800 - A1

b) If you work on 3612kHz and select antenna nr.2 manually, the memory will be changed as follows:

3500-3550 - A1
3550-3600 - A1
3600-3650 - A2 (you work here)
3650-3700 - A1
3700-3750 - A1
3750-3800 - A1

c) If you change the frequency to 3675kHz, antenna nr.1 will be automatically selected by default. If you wish to program the entire 80m band with antenna nr.2, please do the following:

- go to 3525kHz and select antenna nr.2 manually; make auto-tune;
- go to 3575kHz and select antenna nr.2 manually; make auto-tune;
- go to 3625kHz and select antenna nr.2 manually; make auto-tune;
- go to 3675kHz and select antenna nr.2 manually; make auto-tune;
- go to 3725kHz and select antenna nr.2 manually; make auto-tune;
- go to 3775kHz and select antenna nr.2 manually; make auto-tune;

Now antenna nr.2 will be automatically selected for any freqyency within the 80m band.

If you wish to use antenna nr.6 for the whole 15m band:

- go to 21075kHz and select antenna nr.6 manually; make auto-tune;
- go to 21225kHz and select antenna nr.6 manually; make auto-tune;
- go to 21375kHz and select antenna nr.6 manually; make auto-tune;

Please note that the frequency segments have smaller width for lower bands and are wider for higher bands. For instance, the segments are 6x50kHz for 80m and 3x150kHz for 15m. It is recommended to use a frequency close to the center of the segments when you make auto-tune for first time.

10. Note that antennas do not change automatically in STANDBY or when the amplifier is OFF.

a) When the amplifier is not powered (if you use the transceiver without the amplifier), turn ON the selector. Antenna nr.1 will be selected by default in this state. Antenna number will blink until you make a manual selection. You can change anennas manually only from antenna selector UP/DOWN buttons. These changes will be not memorized until the amplifier is not powered.

b) When you turn ON the amplifier later, please do not change the antenna until the 150 seconds count-down ends. After the amplifier is ready ("R" in CW), it will automatically select the last frequency segment and the antenna number that you was using immediately before switching it OFF.

c) In STANDBY of the amplifier you can change antennas manually from antenna selector or RCU.

Be careful about manual changes with powered amplifier: they are memorized in the amplifier's nonvolatile memory. In other words, they are equivalent to a new programming and will change your previous frequency-to-antenna correspondence table.

d) In OPERATE, after a short transmission on a new frequency segment, the antennas (as well as amplifier's band switch and tuning settings) will be changed automaticallly per your table.

Please send me a more detailed information about any item if the amplifier or the antenna selector does not work as expected.

During OFF you can change anennas manually from antenna selector UP/DOWN buttons. When the amplifier is turned ON later, it will select the last used frequency segment and antenna automatically (after the warm-up period).

During STANDBY you can change antennas manually from antenna selector or RCU. These changes however are memorized in the amplifier's nonvolatile memory as well.

Please inform me if you still have any problem, especially the second five check points. It would be a pleasure to do our best for you.

Ok, everybody. I think I know the issue here. It seems that null modem cables are not created equal. The Acom 2000S must have only pins 2, 3 and 5 connected on the DB9. There are some other pins in use on the 2000S DB9 and a standard commercial cable may connect these pins "straight through", causing problems for the switch controller. So, either use the cable that comes with the unit or make up a very simple copy according to the description in the manual. I didn't check this with Krassy, but it may be the answer.

73,

Jim K1IR

From: Mel
Topic: 451 Message: 463

Krassy, I did get a null modem converter which I attached to my straight DB9 cable, therefore making it a null modem cable. It switches pins 2 and 3. My problem is that if I plug the db9 cable I bought into the amp and leave the other end of the cable not attached to anything, the amp still says microprocessor conflict. I then took the null modem adapter and plugged it into the amp and same problem. I then took another db9 cable and plugged it into the amp and left the other end of cable unattached to anything with the same negative results. As it stands now, u cannot plug anything into the amp db9 socket without getting a microprocessor conflict message. Remember, this is happening without connecting the other end of the cable to anything. Mel

Hi ,
This cable must be a "null modem" type
with two DB9F connectors (female 9-pin, with pins 2 and 3 cross-connected).

Bob, if I knew a null modem cable was the answer I would get it. right now I bought the straight cable for $15. and adapter for $6 to no avail. The amp just won't let u plug anything into it. Mel.

It sure sounds like there's something wrong with that cable.

If it's not connected to anything - what else could the problem be ?

Get a real null modem cable - not an adapter.

> Brian, it is not a matter of the amp selecting the wrong antenna, but rather if I hook up the DB9's to the amp and switch I get a microprocessor conflict error when I turn the system on. It then proceeds to turn the amp off. This morning I hooked up the DB9 to just the amp and left the other end unconnected and still got a microprocessor error. If I use the 2000s selector manually everything ok. Amp turns on and I can switch to any antenna I wish. Any thoughts before I throw this switch out the window. Mel.

Tried 4 different cables and the null modem separately. No luck.

Ok, everybody. I think I know the issue here. It seems that null modem cables are not created equal. The Acom 2000S must have only pins 2, 3 and 5 connected on the DB9. There are some other pins in use on the 2000S DB9 and a standard commercial cable may connect these pins "straight through", causing problems for the switch controller. So, either use the cable that comes with the unit or make up a very simple copy according to the description in the manual. I didn't check this with Krassy, but it may be the answer.

Mel,

Unless some of the individual wires are shorted together in the cable,
whether or not it is plugged in should make no difference.

It seems obvious from this perspective that the cable is shorted between one
or more pins.

73,
Bob

470. Cabling it right

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-08 19:45:45 UTC
From: Jim Idelson
Topic: 470 Message: 470

Here is some information that might be useful. First a link to the different wiring options for standard "null modem" cables:

http://www.blackbox.nl/techweb/cables/nullmod.htm

Note that pins 1 and 6 are shorted together in configuration IV, and pins 1,4,and 6 and pins 7 and 8 are shorted together in configuration V.

Second, a detailed review of the Acom 2000 schematics shows that the RS232 connector is used to pass some non-standard signals from the amp CPU board to the outside world. In fact, pins 1 through 9 of the RS232 connector are all populated with signals. Although the Acom 2000S does not use all of these signals, they are present on the amp connector - and they cannot be shorted to anything.

The effect of plugging either of the two standard null modem cable configurations into the amp RS232 port is to short some of these pins. This will confuse the amp, regardless of whether or not the other end is connected to something. I think you will find that this is the cause of these cabling difficulties. You will need to make up a cable that is wired as follows:
Amp Controller
2<----------------->3
3<----------------->2
5<----------------->5

Hope this is the right solution!

73,

Jim K1IR

471. Re: [acom-list] Antenna switching problems

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-08 20:14:12 UTC
From: dick.green@valley.net
Topic: 462 Message: 471

Several comments on the recent switching thread:

1. Jim, K1IR, is correct -- not all null modem cables are created equal. Use only the cable supplied with the ACOM 2000S. Do not use a commercial null modem cable or adapter -- there are many schemes for wiring them and many could be incompatible with the ACOM. If you need a longer cable, you can add a standard male-female straight cable in series with the ACOM cable.

2. The lengthy response from Krassy once again convinces me that ACOM is one heck of a great service company.

3. However, on the switch itself, I'm afraid my opinion is that an amplifier-driven switch is not the correct design for a modern amateur station, especially a contest station. I found that out the hard way, with the expensive DAS controller option for the Alpha 87A. It now sits useless on a shelf.

The most significant problem is that neither the DAS nor the ACOM 2000S allow for automatically switching antennas when the amp is off (although the DAS has front panel switches that let you do it manually.) The second most significant problem is that the antenna does not automatically switch until you transmit on a different band, so the antenna won't change when you change your receive frequency at the rig. You have to hit a switch sequence on the RCU or DAS to do that. The only way around these limitations is to use the ACOM software (is it available yet?), but that requires operating with the computer and amp on.

I much prefer to use an aftermarket setup like the TopTen decoder and switches. With such a setup, the rig controls the antenna and stub selection, regardless of whether the amp and computer are on. I suppose the biggest drawback is that the Kenwood line does not have a band information output like the Yaesu and ICOM rigs, but there's a way around that if you drive the rig and decoder from your computer.

The only rub is that a manual switch box is needed to select among multiple antennas on the same band. The one advantage I see with the ACOM setup is that you can use the RCU to select between multiple antennas on the same band, and both the correct antenna and amp tuning parameters are selected automatically. The original Alpha 87A and DAS were not able to do this -- you could only assign one antenna and set of tuning parameters for each band segment. However, the AlphaMax autotune upgrade causes the amp to quickly retune itself if you switch to an antenna other than the default for that band. In this case you still need an external switch to select between

different antennas on the same band. It's a tossup which is faster -- hitting several keystrokes on the RCU or waiting for the 87A to autotune.

Both the ACOM and Alpha designs are quite acceptable under heavy contesting conditions. The ACOM has the advantage of no delay while the amp autotunes itself, while the Alpha has the advantages of fewer manual movements and less chance of a tuning error.

I think the best design would be for the switch interface box to tell the amp what band and antenna to use, not the other way around. The switch interface box should have a 9-pin input (plus ground) for selecting one of nine bands. The input should be compatible with the output from popular aftermarket decoders (alternatively, a BCD input could be used, but it would have to be compatible with several different rig coding schemes.) The switch interface should also have 10 front panel buttons that allow the operator to select one of up to 10 antennas within a band (it should always remember the last antenna selected on a band and only change it if the user presses one of the buttons.) The switch interface would, of course, use this information to operate the remote antenna switch. There also should be an output port from the switch to the amp that carries both the band and antenna information. That way, the rig would tell the switch which band and antenna to select. This allows the amp to instantly switch without the delay of frequency detection. Of course, the amp should still detect a transmitted frequency change and do the appropriate retuning when necessary. The whole thing can be driven from the rig and interface front panels, with or without the amp being powered on. Alternatively, the band can be controlled by any of the existing programs that feature rig control.

In the end, the user should be able to push just one button to select the band and, optionally, another button to select the antenna. Everything else should happen automatically.

Is that a better design?

73, Dick WC1M

Some more stupid questions (I guess :))

1. What happens if you plug in the cable alone w/o the null model adapter?
2. What happens if you plug in the cable that came w/the switch?

Because unless there was something wrong with the null modem adapter or the cable, I'm just not sure how the amp would know anything was plugged in!?

473. re[4]: [acom-list] Antenna switching problems

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-08 20:20:41 UTC
From: Jim Idelson
Topic: 473 Message: 473

Here is some information that might be useful. First, a link to the different wiring options for standard "null modem" cables:

http://www.blackbox.nl/techweb/cables/nullmod.htm

Note that pins 1 and 6 are shorted together in configuration IV, and pins 1,4,and 6 and pins 7 and 8 are shorted together in configuration V.

Second, a detailed review of the Acom 2000 schematics shows that the RS232 connector is used to pass some non-standard signals from the amp CPU board to the outside world. In fact, pins 1 through 9 of the RS232 connector are all populated with signals. Although the Acom 2000S does not use all of these signals, they are present on the amp connector - and they cannot be shorted to anything.

The effect of plugging either of the two standard null modem cable configurations into the amp RS232 port is to short some of these pins. This will confuse the amp, regardless of whether or not the other end is connected to something. I think you will find that this is the cause of these cabling difficulties. You will need to make up a cable that is wired as follows:
Amp Controller
2<----------------->3
3<----------------->2
5<----------------->5

Hope this is the right solution!

73,

Jim K1IR

> Mel,

Unless some of the individual wires are shorted together in the cable,
whether or not it is plugged in should make no difference.

It seems obvious from this perspective that the cable is shorted between one
or more pins.

73,
Bob

cables are not created equal. The Acom 2000S must have only pins 2, 3 and 5
connected on the DB9. There are some other pins in use on the 2000S DB9 and
a standard commercial cable may connect these pins "straight through",
causing problems for the switch controller. So, either use the cable that
comes with the unit or make up a very simple copy according to the
description in the manual. I didn't check this with Krassy, but it may be
the answer.

Its very true that not all null modem cables are created equal. I hooked up my RigBlaster to my pc with a null modem cable. Turned out it was crossing more than just the required pins. I ended up going to Radioshack and bought one of they're cables. There was a schematic on the back of the box to confirm that it was the correct cable. The Radioshack cable follows Jim's pinout.

I have the 2000sw switch and used the supplied null modem cable to connect the switch controller to the amp. No problems here.

477. Re: [acom-list] Antenna switching problems

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-08 21:04:59 UTC
From: Brian, N8WRL
Topic: 451 Message: 477

This a great idea!

The only thing I would add is the ability to interface the switch to the computer so I can use it to select band and antenna (or just antenna within a band since I'll be setting the rig freq too). I've been playing with the notion of minimizing rotor movement by selecting antennas 'close' to where I want to go. Example - I have a tribander fixed on EU and another that rotates. I know the rough beamwidth of both on all 3 bands. If the rotatable one points to OC, for example, and I want to work someone in EU quickly (maybe from a spot) I'd like the computer to figure the bearing to the station to work, notice that it is out of the beamwidth of the rotatable beam, and that the EU beam is close enough. Set the rig's freq (which might set the switch's band) and then set the antenna within that band. By the time all the settings are done, I'm in QSO and the top beam hasn't moved, all set to continue w/OC! Dreaming?

Dick--

Well spoken. This is exactly what is needed.

There is another to using the rig to select the antenna. Having the xcvr select the antenna guarantees the correct antenna is selected before the amp transmits. That eliminates spurious fault conditions which can occur. I used to have this fault problem using the computer to run the antenna decoder box. It had a second or two delay in switching to the correct antenna. Accidently tripping the vox in this interval (wrong ant still attached) caused the amp to trip.

Also do away with the network nonesense. Make this data via some hardwire connections.

One still needs some way to handle multiband antennas. There still needs to be something between the rig BCD output and the antenna switch to select the same antenna for several bands. I'd like to suggest that function become what the switch box does.

Mel,

Please believe me. If you remove the cable from the amp, do you get a clean startup? If so, then you know the cable is shorting some pins. You should order the right cable from Krassy. It will work. Or, you can build the one I suggested. It's only 3 wires. You don't need to reset the CPU on your amp. You'll lose all your user settings and it won't help the problem.

Jim K1IR

> No Brian. I did not get a cable. I am going to ask Krassy to send one. But, I cannot believe it is the cable. I only hook cable up to amp and leave other end unconnected and it still gives me microprocessor error. I think I have to rest the processor.. Mel

cables are not created equal. The Acom 2000S must have only pins 2, 3 and 5
connected on the DB9. There are some other pins in use on the 2000S DB9 and
a standard commercial cable may connect these pins "straight through",
causing problems for the switch controller. So, either use the cable that
comes with the unit or make up a very simple copy according to the

description in the manual. I didn't check this with Krassy, but it may be
the answer.

I haven't been following this thread too closely, as I don't have an
Acom antenna switch, but...
I have been a beta tester for W1VE's amp controlling vaporware
(sorry Gerry), and it required the same null modem cable
connected from the amp to a COM port - just a 3 wire cable, as
described. It did NOT work when used with a store-bought null
modem cable.

483. Re: re[2]: [acom-list] Antenna switching problems

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-09 00:47:32 UTC
From: Mel
Topic: 462 Message: 483

No matter what I plug into the amp I have microprocessor problems. I must have plugged in 4 different cables. Even plugged in the null adapter alone. No cable came with the switch. I think that is my problem. I will ask Krassy to send me the 3 wire cable with pins 2 and 3 switched and 5 straight through. Hope that solves problemmy.

Subject: Re: re[2]: [acom-list] Antenna switching problems

Some more stupid questions (I guess :))

1. What happens if you plug in the cable alone w/o the null model adapter?
2. What happens if you plug in the cable that came w/the switch?

Because unless there was something wrong with the null modem adapter or the cable, I'm just not sure how the amp would know anything was plugged in!?

From: A. J. (Jim) Movius
Topic: 451 Message: 484

The switch discussion is interesting and suggests that for now I continue use of a manual 6 position Coax switch w/ two 4 position remote switches to switch among antennas. My two year plus old 2000A (Serial No. 990147) has accumulated 1320 hrs of flawless operation, except for failure of 2 Molex heater wire connectors. The 3 pair of connectors were replaced at no charge after the warranty had expired.
Best Regards, Jim KL7JM

This is the right answer Bob. Some of the null modem cables except cross lids have shortened pins. It is difficult if you really don't know what you doing to find in the computer market the right cable.
Any way I supply Mall with the right one.
Krassy

Krassy....
My switcher manual doesn't even say anything about
a null modem. I must have an old one. Mel, K2AT, says
you sent him a cable and everything is fine. I never got
a cable with mine. Please send me the proper cable dear
friend. Right now I must change everything manual!!

487. acom.exe on CD-ROM

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-17 00:56:01 UTC
From: dick.green@valley.net
Topic: 487 Message: 487

Just got the CD, and I've been playing around with the MD-DOS tuning program, acom.exe. It's really pretty neat, although it seems to be somewhat buggy and the interface isn't terribly friendly. Needless to say, I'd love to see a Windows version. I'd also like to see a command that would let me do an AUTO tune on one column (antenna) at a time -- I don't use the 2000SW and need to throw some switches in between antennas. I'd like to just say, "tune all the frequencies under A1", then "tune all the frequencies under A2", etc.

Speaking of that, I was unable to get the program to work in a DOS box under Windows. I had to boot my machine into MS-DOS. Has anybody gotten it to work in a DOS box? I can't set the rig frequency or communicate with the amp. Common problem with DOS software that accesses COM ports, but can be avoided with proper programming.

Oh yeah. It sure would be nice to be able to select *any* COM port for the rig and amp.

Still, it's really cool doing an AUTO tune for all bands!

488. G2 ERROR

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-17 19:33:53 UTC
From: Turkisher Dan-CSLC82
Topic: 488 Message: 488

My amp was last used about two weeks ago, all OK.

Went to use it today and after the 2 minute warm up I hit the OPERATE button and it immediately shuts down with a "G2 VOLTAGE TOO LOW: 50V" error. Not even a chance to put RF into the amp, it shuts off immediately.

The manual says to power it off for 5 minutes then retry (no joy). Manual also says to reduce drive and perform tuning procedure, but the amp shuts down immediately upon entering OPERATE mode so reducing drive and retuning are not possible.

Any ideas as to the source/resolution of this problem???

Thanks and 73

Dan

It's speculation, but my guess would be a bad tube. I had one go bad shortly after I bought the amp. As I recall, the error was too much grid current, but I can't remember.

490. Tube Replacement / Tech Supplement

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-17 20:09:19 UTC
From: dick.green@valley.net
Topic: 490 Message: 490

I have a question into ACOM about this, but maybe somebody here knows the answer. The manual says:

"6-4. Tubes Replacement

The new tubes must be supplied as a Matched Pair with close electrical characteristics. Otherwise one of the tubes will bear an excessive share of the operating currents, which will lead to overheating and reduced tube life.

Two 4CX800A (GU74B) high performance ceramic-metal tetrodes manufactured by Svetlana are employed in the amplifier. This is a complex and possibly dangerous operation. For this reason we recommend this work is carried out by a trained service technician. See the TECHNICAL SUPPLEMENT for details."

OK, so where's this TECHNICAL SUPPLEMENT? I asked Krassy for it a long time ago and he just recently sent me a CD that contains complete schematics, pictures, the operating manual, and the DOS tuning program. No "Technical Supplement" and no information about replacing tubes.

My amp lost a tube shortly after I bought it and Krassy did the replacement (coincidentally, I was able to carry the amp to him instead of shipping it.) He told me that new tubes require adjustment behind the front panel. I expected the procedure to be in the Technical Supplement, but there's nothing on the CD about it.

I feel it is unreasonable to expect people to ship an amp just to replace the tubes. I'd like to keep a spare set on the shelf and be able to replace them myself should something go wrong in the middle of a contest.

Has anyone seen the Technical Supplement or a set of instructions for replacing tubes?

73, Dick WC1M

Hi Dick,

Also had a tube failure with "bias too low". It was a cathode to grid short. Unfortunately, this was found out only after shipping the amp back to ACOM. That aside, ACOM sent me E-mail containing a "step by step procedure for tube replacement. It covers:

1. Old tubes removal
2. Mounting new tubes
3. ideling plate current adjustment ("after any tube replacement the bias voltage needs to be adjusted. There is a sub-menu in the service menu... It goes on to discuss the scredwriver adjustment of potentiometers RP1 AND RP2..
4. Reassembling the amplifer.

It was signed by LZ1JK and K1LZ.

I'd be glad to FAX it to you if you are in a time crunch and can't get it directly from Krassy.

Guys,

I scanned in a file of the 5 pages Krassy sent me for tube replacements. I have it in a zipped 400K file of bmp images. I don't know if this list permits attachments. If you don't get the attachment, e-MAIL me a separate request.

The low grid voltage could also be some problems with molex connectors or other things.

Brian,

Since I could find no sign of the downloaded file on the Acom list I assume
it didn't make it. If possible could you forward the file at your leisure?
Additionally, I have seen references to the Acom.exe file that some people
have. I wonder if you have information regarding that program?

Thank you for your help.

Check the varistor on the screen grid (access by opening the metal plate on the bottom of the amp). Mine failed last year, Krassy sent a new one, and it was an easy fix. The amp will never go into active mode because the screen cannot reach the necessary voltage (~340V, I seem to recall). This is good. The amp is protecting itself.

From: N2TK
Topic: 490 Message: 498

I understand that there is a fix for the early 2000's which used Molex connectors for the tube heaters. I understand that they have been replaced with another type of connector. My symptom before replacement of the connectors was low heater voltage.

Guys,

I scanned in a file of the 5 pages Krassy sent me for tube replacements. I have it in a zipped 400K file of bmp images. I don't know if this list permits attachments. If you don't get the attachment, e-MAIL me a separate request.

The low grid voltage could also be some problems with molex connectors or other things.

Hi Will,

This software project has taken much
much too long. There have been a lot
of delays which have nothing to do
with Acom! (They are due to my time
constraints).

I am in the final stages. Currently
waiting for a email response from Vasco
about one final issue.

Too good things I can tell you:
1. LogWindows support is built in and works
great.
2. The software will be released as freeware.

No promises on the date, but I am pushing
for this month.

From: alsopb
Topic: 503 Message: 503

This past WPX was interesting. There were scattered thunderstorms from Friday until Saturday.

Murphy stayed away however, it was frustrating having to wait for the ACOM 2000A amp to come back on line after the many fractional second power interruptions we had. Around here these happen without a really local thunderstorm. One does loose his run frequency.....

Any small glitch and it restarts. If you are quick you might be able to avoid the full startup delay.

Funny that neither the FT1000MP, computer or monitor were affected by these glitches.

I wonder if it is a matter of adding a big capacitor somewhere as an energy storage device for the control head processor?

504. Antenna switch RS-232 'sensitivity'

Yahoo group: acom-list (1999 — 2009)
Date: 2001-05-29 00:58:48 UTC
From: Brian, N8WRL
Topic: 504 Message: 504

Hi all!

I'm working on a fun little project but I've run into a snag. I'm working on a little microcontroller-based box (BASIC Stamp) that will track the band data coming out of my FT990 and select antennas accordingly. I know there are products that do that already, but I'm hoping to make this 'smarter' to allow me to remember the last antenna used, switch antennas only for the band the rig is on, etc.

Anyway, I'm at the point where I'm trying to send the serial data from the microcontroller to the 2000S to tell it to select an antenna. I've done some testing from my PC talking to the switch thru a NULL MODEM cable at 1200 baud with success. I can send commands, get it to switch antennas, etc. Neat!

My first pass at doing the same from the microcontroller isn't working. The chip basically has a bunch of I/O pins you can hook up to things, and a bunch more commands you can use to do things with the pins. One of these is called 'SEROUT' that takes a pin#, baud specification, and a bunch of bytes and toggles the pin at the correct baud rate with the data you give it. I can connect a DB-9 to that pin, hook it to my PC and see the data appear in HyperTerminal.

Trouble is, the switch doesn't like it. I suspect that the problem may be that the pin is toggling between 0 and 5 volts and the RS-232 standard toggles between -10 and 10 volts. Many devices (like my PC) aren't that picky, but I wonder if the 2000S is? Anyone know? Krassy? If so, I need to get a line driver.

Thanks!

-Brian

Second thought, have you got the polarity right? If you use the
hookup in the stamp documentation using just a resistor you probably
need to use inverted polarity. However, if you have the stamp and PC
talking already, you already know this. One must do the same to talk
get the stamp to talk to the PC.

I was successful in getting the stamp to talk to the ACOM2000a via the
simple 1 zener diode and resistor converter used to drive the TS850
from a PC. The stamp has the equivalent of the zener diode internally
to clamp the voltage. Thus the 1 resistor hookup in the stamp manual
should also work.

My suggestion is to try and get the stamp to talk to the PC first from
two of the stamp output pins. Once you can do this, it is likely you
will get the stamp to talk to the acom switch box.

I got the stamp to talk to the ACOM2000 via a simple circuit used to
convert between the TS850 and PC. It was just a zener diode and
resistor. The stamp has the equivalent of the zener diode clamp
internally. It did no voltage level conversions.

506. Disabling automatic antenna selection

Yahoo group: acom-list (1999 — 2009)
Date: 2001-06-01 14:13:37 UTC
From: Brian, N8WRL
Topic: 506 Message: 506

Good morning!

Is there anything more I have to do to keep the 2000A from automatically switching antennas based on what it 'thinks' is the last antenna used for a frequency segment? I went to the 'def' menu and set 'automatic antenna switch' to 'off' but it seems like it is still doing it. I _do_ want it to be 'aware' of the different antennas (I have a couple for the same bands) so if I say 'use 4' and transmit on 20m I want it to tune up for that segment on antenna 4. Ditto for 5, so I don't want to retune everything for one antenna...

-Brian n8wrl

This is one of the functions I wanted. I thought your communications with the switch box and amp via network was going to take care of this.

It does bring up an interesting question. How I use multiple antennas is to switch between them and see which is loudest. However, it seems like a bit hard of the ACOM to follow this switching in the RX mode. It seems like in addition to the switching of the ant during RX one needs a second pushbutton which then tells the amp "I want this antenna - change your settings to it now"

Hi Brian!

You're right on. I see two pieces to this.

First, I do not want the amplifier picking antennas based on xmit freq. I want it to 'make do' with the antenna it is on (however it got there - more later) hopefully by tuning up or picking the right 'usr' tuning for that segment/antenna.

Second, I want my 'acom comms' to have some smarts about picking antennas. There are several aspects to this:

* Detect band changes made by the radio and select the antenna last used on that band, and tell the amp & switch about it (can't pick tuning segment, but at least band & ant gets close).

* Allow me to change antennas manually within the set of antennas which make sense for that band - again, tell the amp/switch about the choice.

* Allow me to pick antennas _outside_ of those that make sense for the band the rig is on, but inhibit xmit.

Now I'm not yet sure how much 'slaving' of the amp I want each time the band changes and/or antenna changes. I definately want the switch to change, but maybe not the amp (not sure if you can do one without the other in the acom networking schem). This still seems ok since I can detect the 'tx-gnd' change when the rig xmits, inhibit it, and tell the amp to change at that time. Might be more trouble than it's worth since the amp will probably change right along with the switch.

Anyway, I'm still confused about my original question - did I do enough to stop the amp from automagically changing antennas? That would put a big crimp in the whole plan, and since it is guessing wrong it is really annoying!

-Brian

509. Re: Disabling automatic antenna selection

Yahoo group: acom-list (1999 — 2009)
Date: 2001-06-02 17:30:34 UTC
From: dick.green@valley.net
Topic: 506 Message: 509

Brian,

I just did some experiments and determined that my amp works like this (I don't have the 2000S antenna switch):

Auto ON: The amp remembers the last antenna selected on each frequency segment. This works well when you have antennas that cover different portions of a band. For example, you might have separate dipoles for 80M CW and 75M SSB. When you go to a frequency segement for the first time, you manually select the appropriate antenna using the left/right arrow keys on the RCU. You have to press ENT to make the selection take. From that point on, whenever the amp detects a QSY to that frequency segment, it will remember the antenna you selected and retune to it. This is the mode I normally use. Unfortunately, it doesn't really do what I want, because I have antennas that cover the same segments on certain bands. What I really need the amp to do is follow whichever antenna I select with my Top Ten decoder and manual switch box (more on this below.)

Auto OFF: The amp uses whatever antenna you select from the RCU. It uses that antenna regardless of the segment selected. What's really annoying about this is that the amp writes your antenna choice to the memory of *every* segment. Thus, when you go back to using Auto ON, every segment is programmed to use the last antenna you selected in Auto OFF mode! This is a bug or design flaw in the firmware. It should have a single memory location dedicated to the single antenna selection made in Auto OFF mode, and should not mess with the antenna memory for each segment. Switching between modes would simply determine whether the single location or segment memories are used.

I don't have the 2000S, so I don't know if the amp does anything different when it is connected.

I suggest you read the post I made in May about this subject. In it, I describe what I think would be the ideal design. The idea is that the amp and switch should both be controlled by a combination of the transceiver, a band decoder and some manual switches. When you QSY on the transceiver, the band decoder information *and* the settings of a manual antenna selection switch would determine the correct antenna to use and that information would drive the amp and switch separately.

Since you are doing a Basic Stamp project, why not build it to do this? What I would do is build a panel with a set of monetary push-button switches, one for each antenna in your system. If you push one of the buttons, the Stamp would tell the 2000A and 2000S to select that antenna (requires two RS232 outputs from the Stamp.) The device

could also be designed to drive realys in other commercial antenna switches through a set of transistor outputs. Ideally, the Stamp would illuminate an LED that tells you which antenna is selected (or if you'r really ambitious, it could display that information on a small LCD panel.) The Stamp would also have an input from the transceiver's band data jack. When a new band is selected at the radio, the Stamp would tell the 2000A to QSY to that band. The Stamp would remember which antenna was selected for each band, so the amp will always use whatever antenna was last used on that band, unless you decide to change it by hitting one of the antenna selection buttons.

A better design would be to have the Stamp driven by the transceiver's CAT port. That way, you could detect which band segment to use and keep track of different antennas for each segment. Unfortunately, this won't work if you need the CAT port for contest software. However, clever use of diodes will allow you to tap the CAT port and have the Stamp monitor the traffic between the computer and radio. Then you could detect the frequency that the radio is set to and control both the amp and antenna switch using that information and the push buttons.

I don't know if the Stamp can support so many I/O channels. If it can, this would be a great device. I'd buy one.

Topic: 506 Message: 510

Hi Dick,

I think it is a bit more complicated than your design. Multiple antennas/band or segment is a problem. These are selected manually external to the amp via the user-- it could be a separate antenna, stack, part of a stack or whatever. Each presents a different impedance to the amp. One has to be able to tell the amp (before xmitting) to dial in the new loading settings.

N8RWL is working on something which is similar to what you are describing. He has both the switch box and amp. He's using a stamp.

The BS2 stamp has 16 I/O lines. They can be TTL or RS-232. If that isn't enough there is a BS2SX-p chip with 32 I/O lines operating at 50MHz! It's about a $100 chip.

I started out to just drive the amp switch setting via the stamp. However, I could never master the network nonesense. I could tell the amp to do something and it would return stuff but never shut up. It just sent the same stuff back every second. Among other things it requires one constantly tell (ever min or so) the network that you're attached. It requires passing the info along to all others on the network etc. Much too complicated. All that was needed was something similar to a rotor interface. Query a device, the device talks back after handling whatever is requested.
I gave up.

What the ACOM amp really needed was simply a BCD input plus and enable line. One specifies the antenna # to it and it then (when told to via the enable line) looks up the settings for the last freq it was at and dials them in. If the freq is in a different segment then it goes through the current process of changing to the appropriate settings for the specified ant in the new segment.

Couldn't be simplier.

Topic: 506 Message: 511

Thanks so much for taking the time to experiment with this. I have to just sit down and do an exhaustive test - I haven't changed antennas much with the amp's control panel, just the switch. The amp makes the same antenna changes the switch does, so I assumed the result would be the same as making the selection via the control panel. Maybe not.

With auto switching on, it does things that astonish me sometimes. Among others, I have two tribanders and a warc beam. I'll carefully tune each up and operate, being careful to watch the antenna selected on each band. Then, I'll QSY to 17m, transmit, and the amp will select one of the tribanders and complain! I _know_ I never transmitted with that antenna on 17m, so I don't even know how it made that choice.

That's why I'm giving up on all the auto-change-on-xmit nonsense and try my hand at building something that makes antenna changes for _receive_, which is really when I want it. But, to get this to work at all, I have to stop the amp from making its silly selections.

As of now, I have 'Auto Antenna select' to OFF and it seems to still change the antenna when I xmit. I have to play some more I guess...

I didn't want to bother anyone on this reflector with it, but I'm working on a BASIC-stamp-based project. K3KO has been mentoring me on the hardware stuff so I've been keeping him posted on my results so far. Here's what I sent him last night:

...
I got some of the 'funky' 8-pin DIN's for the FT990's Band Data jack from RF-Connection today. I wired one up and hooked the band-a...d lines up to the stamp and tweaked my code a bit. Here's what it does now:

* I'm using one of those 2-line 16-char LCD displays to show band and antenna data. It would look something like this:
15m > 5=C31XR
* It has a list of bands, my antennas, and which antennas work on which bands.
* It Tracks band from the radio - as you change bands, it selects the last antenna used on that band (if there was one) or the first antenna defined for that band.
* There are up/down push-buttons for changing antennas. It cycles thru the antennas listed, and if the selected antenna is ok for the band the radio is on, it 'clears' it for xmit and remembers it for the next band change. If not, a blinking block appears, warning you not to xmit on this antenna.

I'm expecting the MAX232 chip next week so I hope to get the antenna changing signals to work too.

Some other ideas I have - wonder what you think:

* Handle the rig's tx-inhibit signal to prevent transmitting on an antenna that is not good for the band the rig is on. (Put some 'teeth' in behind the 'blinking cursor' :))
* Some sort of switch that forces antenna changes to stay valid within the current band or open it up to any antenna (with the 'do not xmit' flag).
* I'd like to use two radios with one amp, so perhaps I can use the tx-gnd signals from each rig to tell which radio wants to transmit. Based on that radio's mode and antenna selection, trigger relays to line them up with the amp, retune the amp as needed, all while keeping tx-inhibit on until everything is ready. Seems like this might be a neat feature for SO2R with one amp!

Hopefully I'll get the rs232 stuff worked out next week (travelling, but I'll be home for the weekend).

73!

-Brian

From: Brian, N8WRL
Topic: 506 Message: 512

Well it definately matters where the antenna change commands come from! If I change antennas from the switchbox, the amp acts like auto-change is on and goes back to the antenna it used before. If you change antennas from the RCU, it stays put.

Two antennas, both tribanders (10/15/20) #4 and #5.

Amp and switch are on #4
28.1 - send a dit - amp stays on 4
21.1 - send a dit - amp stays on 4
Using switch, change to 5
21.1 - send a dit - amp stays on 5
28.1 - send a dit - amp goes back to 4!
21.1 - send a dit - amp goes back to 5!

Start over - using RCU, amp and switch are on 4 again
28.1 - send a dit - amp stays on 4
21.1 - send a dit - amp stays on 4
Using RCU, change to 5
21.1 - send a dit - amp stays on 5
28.1 - send a dit - amp stays on 5
21.1 - send a dit - amp stays on 5

So it seems pretty clear that you shouldn't be using the switchbox for changing antennas if you want the amp to behave. I wonder why that is?

-Brian

Oh boy this is scary!

I've been experimenting with sending commands to the switch and the amp to get it to change antennas. Until tonight, I was just playing with the switch - amp was off. Serial cable connected to 'PC' port on switch, and slider set to 'PC', not 'AMP'.

I could reliably send a command like 'QqW34' which means, To switch (Q), from PC (q), change antenna (W3) to #4. All this comes from the switchbox manual.

With the amp turned on, things get pretty weird (and scary) fast!

I have found that when the switch's slider is in PC and not AMP, changes made to the antenna on the RCU are ignored by the switch, and the amp complains about the switch malfunctioning. You cannot control the switch from the amp if the switch is expecting commands from the pc.

So I tried controlling both from the PC.

I have a copy of a spreadsheet Krassy sent me that seems to summarize the serial commands you can use, but it is pretty (very) cryptic. It says W3 'Retrieves last motor settings for current segment with antenna x from nonvatile memory'. You have to change the address a bit since the amp will be 'A':

AqW34 - the amp and the switch both go to #4. You can transmit on the band the amp shows and it looks good.

But, Change bands and transmit - the amp makes a 'tuning sound', it cycles from oper-stby-oper but you can't transmit! Manually go to standby and the display changes to reflect the band change you made BUT the LAST antenna for that band, maybe not the one you sent! Back to oper and you can transmit.

Now it gets worse - if you play with these commands after a while and try to transmit while it is having trouble communicating with the switch you'll get some sort of a 'G2 Voltage Too Low' fault and I have to physically cycle power on the amp to wake it back up.

I stopped playing at that point.

What the heck is this?? I'm working on this project to track band changes from my radio and select antennas and tell the switch & amp about them. It seems pretty clear that this isn't going to work!

The only thing so far I haven't tried is taking the switch out of the loop - connect directly to the amp to see what happens... I'll do that next.

From: Brian, N8WRL
Topic: 513 Message: 514

Quick followup - with the amp disconnected from the switch altogether and connected directly to the PC it behaves just like it was connected to the switch - if the antenna change command came from the RCU, life is good. If not, it does its 'auto switch' business. I guess I should have expected that because I am sending the same commands the switch would...

I've sent a note to ACOM - hopefully someone will reply.

Brian,

Remeber that the serial "network" is round-robin!

Since TX from the PC is connected to RX on the Switch, and TX on the Switch is connected to RX on the amp, and from the amp vice versa, when you issue a command to change antennas with the switch connected, the reply from the switch that the action completed OK MUST be echoed by the PC back to the amplifier... This puts a little more burden on the PC, and is completely different when the switch is not involved.

I have a non-ham software engineer, who I work with on a professional basis on other projects, working at the Acom factory in Sofia at the moment. He is working with the guys there to build a very solid communications controller component. This will be an Automation Component which canbe used by any Windows application. It won't help you PIC/uController guys, but it will make PC-based control very straightforward.

Yes, the protocol is tricky. I am setting up the PC application to both control the switch seperately from the amplifier, and with the amplifier in place. From a contesting perspective, I think it will be more flexible to have antenna control seperate from the amplifier. This will require another COM port, but I think it is a good tradeoff.

516. Antenna Control by Frequency...

Yahoo group: acom-list (1999 — 2009)
Date: 2001-06-03 12:01:34 UTC
From: Gerry Hull
Topic: 516 Message: 516

Guys,

Just to let you understand how I've implemented antenna control by frequency, when using seperate control via 2 COM ports:

1. Operating Frequency is determined by a plug in to current software application in use; the frequency info comes from your radio.

2. In the user interface, you describe the antennas on the 10 ports of Acom Switch, in terms of
1. operating frequency range,
2. Is it the perferred antenna for that range.
3. Text Description.

Of Course, overlapping ranges are important!

3. The software remembers the last antenna used for a given frequency segment. When you return to that frequency range, the last-used antenna will be reselected.

4. If you go to a frequency which has no previous antenna, the default antenna for that segment is used.

Gerry,

It is more than just another COM port needed.

Unfortunely you are targeting WINDOWS. Neither this nor a DOS
dedicated task helps most of us. The NA/TR/CT programs are still all
DOS. CT does not work at all in a window. Writelog has its own
problems and illustrates the problems inherrent in WINDOWS based
contest programs.

Anyhow what we don't need is another window/program to hop to to
change antennas. Analog switches still seem to be the most efficient
user interface here. This is why the PIC/STAMP path was chosen. IMHO
one needs a software solution imbedded in a hardware chip which is
independent of the PC or operating system used for the logging
software.

Go for it, Brian!

I am targeting Windows; for you guys who want to do the PIC way, go for it! If you want to stick with NA/TR/CT, that's a good solution! If you build a solution for those apps, and want to share it or sell it, you're welcome. I building a Windows solution because that's what a lot of people are using and have asked for. If your are willing to share your efforts, I'm sure you'll make a lot of people happy.

I think that if you want to look at the top-ten box for many major contests, you'll see a lot of Writelog users in there. At some multi operations, we use CT because we have alot invested in the infrastructure. At other stations, we use Writelog.... 25Meg+ scores without any "problems inherrent in WINSOWS based contest programs." Anyway, no need to get into a religous war over "who's the best" in contest software... I own CT/NA/TR and Writelog! From a software integeration point of view, the Windows platform makes it very easy. And, besides us contesters, there are lots of DXers and casual hams out there running windows software -- Right now I have interfaces designed for LogWinows, DX4WIN, and TRXManager.

Since these software solutions for antenna switching are new, it is a tough decision to rework an infrastructure if you've invested alot in TopTen/Array Solutions/and DOS-based applications.

Perhaps another PIC solution, besides the ACOM, would be a serial interface to a PIC, providing "generic" frequency information to drive antenna switches, so that you can eliminate the need for a decoding box for each type of radio... Anyway, that is best taken offline of this ACOM reflector.

Hi Barry and others,

Sure. As I mentioned in the previous post, I have had the fortuneate luck working with a very excellent Windows software engineer, on full-time commercial work, who happens to live in Sofia, Bulgaria. Although not a ham, he understands hardware very well, and has an excellent command of English. By having someone one site, we can resolve all the remaining issues quickly.

He has been parked at the ACOM factory in Sofia this week, writing a new interface component for me, working out any wierdness in the communications protocol, and getting everything solid.

(BTW, Krassy has been there since last weekend; he will be back Tuesday)

There have been lots of reasons why this software has been delayed, which you don't need to hear.

I expect my partner in Sofia to be finishing up this week, and as soon as integrate with his results, we will have a version posted for you guys to play with.

HI Gerry - thanks for the reply!

For simplicity, let's stick with the 'single control' scenario - PC to amp.

PC->Amp - I can send the W3 command to change antennas, but even with the 'auto antenna change' set fo 'off', it STILL changes to the last antenna used on that segment when I key up. This does not happen if the antenna change happened from the RCU. Have you seen this?

What I'm trying to do is keep things as simple as I can - I was hoping that once an antenna was set, the amp would still sense frequency when the rig keys up and tune up on the right segment for _that_ antenna (not try to change). I'm hoping I don't have to send antenna _and_ segment because that means I have to monitor rig freq! It would be much simpler if I didn't have to do that...

Any ideas on why the amp is doing this?

530. FILIAMENT CURRENT TRIP

Yahoo group: acom-list (1999 — 2009)
Date: 2001-06-23 23:43:04 UTC
From: alsopb
Topic: 530 Message: 530

Guys,

At 626 hours the amp starts up and in 12 seconds it trips:

Filiament current too low:
0 amps.

The amp worked fine the last time it was turned off a day ago.

One can't do a heck of a lot of troubleshooting in 12 seconds.

My first guess is that the tube filiaments went open. However, if I
believe the 0 amps, both would have to have failed simultaneously--
SEEMS highly unlikely. Will pull one tube and check it.

Next guess bad molex connector in the filiament circuit.

Next guess bad LV xfmr.

Has anyone else out there had this trip? How was it fixed?

73 de Brian/K3KO

531. Re: [acom-list] FILIAMENT CURRENT TRIP

Yahoo group: acom-list (1999 — 2009)

From: alsopb
Topic: 530 Message: 531

After digging around a bit, I think I found the source of the problem.

The tubes were fine.

However, the molex connector (JP6) had one pin which blackened and partially melted the pin connector cavity. The receptacle pin was somewhat corroded. The PC board pin was fine except for a tiny pit--probably where the only point of contact was.

I pulled the receptacle pin from the block, cleaned it and sprung it out some for a snugger fit. Since the melting enlarged the cavity some, I stuck a piece of wooden toothpick in the extra space. When JP6 was reseated on the PCB pins, I made sure all were firmly down. The problem pin seemed to be making good contact again.

To get at this one has to remove the power transformer. JP6 is easily accessible afterwards.

The amp started up OK.

I'll have to ask Krassy on Monday what the permanent fix is. I really hate Molex connectors! A buddy of mine had one fail in his QRO amp filiament circuit also.

Brian,
I think you did some good detective work. I had a similar problem. Krassy advised returning the unit for replacement of Molex connectors since they had a bad batch (about 50) in certain serial numbers (possibly first 50). Apparently they are being replaced on a as needed basis. Took about a week to turn it around. All in all I'd say can't expect much better service.

Howard..K2HK

Greetings,

Mine did the same at about 1000 hours, traced to 2 burned Molex connectors-
there are 3 pair in the filament power leads. Acom supplied new connectors
at no charge even though my unit was out of warranty. Explanation was bad
batch of connectors for the earlier units. My Serial No. is 990147,
purchased Spring 1999.

Three pair? Could you expand on that? I only see a single connector
with four leads on the LV board. Guess I have to look at the other
end at the tube socket board. After "fixing" it, the problem occurred
again after a few more start-ups.

Hello Jim,

I'm sorry that you have a problem with our amplifier. Since we have had several similar problems on other amplifiers, I suppose that it's the same again. Obviously, we have supplied a bad lot of connectors for the heater circuit.

If you don't feel comfortable with repairs, you could send the amplifier to Krassy/K1LZ in MA, we will ask him too. If you however wanted to repair it by yourself, here is some technical information you may need.

There are three connectors in the heater circuit. Please make an internal visual examination as described below. Please check also the file "A2HTR.pdf" that is attached to this file: it contains a schematic diagram of the heater wiring.

****
****

Safety First!

W A R N I N G HIGH VOLTAGE!

==========

The amplifier works with high voltages up to 3000V which is LETHAL! For your safety pull the amplifier power plug out of the mains wall outlet and WAIT AT LEAST 30minutes EACH TIME BEFORE you remove the cover of the amplifier. Disconnect all cables from the amplifier (grounding last). Do not touch any part inside while the amplifier is open because some residual voltages may still be present!

****
****

Pull the mains cord out and wait about 30 minutes to let the residual charges accumulated in the high voltage circuits to discharge. Remove the top cover of the amplifier. Check carefully whether the LID CROWBAR (mounted on the middle chassis wall) does reliably short-circuit the HIGH VOLTAGE when the top cover is removed. Remove the high voltage power transformer.

Look over the heater connectors: maybe they have marks of overheating if a bad connection is present there. If they are natural-white color, please remove all three of them. You can

solder the wires directly to the PCB in the tube deck (using additional insulation tubing). On the LV transformer and supply PCB side it's better to use "free-hanging" external connectors (for 8-10A nominal current) instead of soldering them directly.

If the connectors are orange color and seem to be in good condition, you may left them as they are since we have not met problems with them till now. If however they are natural-white color, please remove them even if they seem OK: you would prevent an eventual future problem since these are of a bad lot.

C A U T I O N

Please pay attention not to interchange four wires while removing the connectors, so reconnect them ONE BY ONE!.

Here is more information about the heaters circuitry and how to access its wiring.

1. Find the Low Voltage (LV) Supply PCB which is located behind the apparent front panel, just below the HV rectifier and below the HV filtering capacitors block. It is mounted on a L-shaped little aluminium chassis, together with a smaller black (150VA) transformer. This transformer supplies the heater voltage to the LV PCB, via a 4-contact connector (four heavier wires). The connector is located just on the LV PCB's corner, on its right-side edge (facing front).

2. On the LV PCB the heater voltage is controlled by two relays: the HTR-ON (K1) and HTR-STEP (K2) relays. Then it is fed through a similar 4-contact connector (same as JP5) and another four heavy wires, via the cable harness, to the tube deck. The second connector is located on the same PCB's corner, but on its back-side edge (laying in parallel to the front panel).

3. Remove the little cover under the tube deck in order to access the third heater connector (marked JP1). For this purpose place the amplifier laying "up side down" on the table in order to access a small bottom cover below both tubes. Unscrew its 6 periphery screws M3x8 (do not unscrew screws inside the cover area).

Be careful - a PCB and a power resistor are mounted on this cover and are connected with cables to the tube deck. Displace bottom cover carefully and apply external light. Examine tube deck inside.

The four heavier wires come in the tube deck and connect there via a 4-contact connector (of the same size as in the LV PCB, marked JP1), to the tubes sockets wiring. Look over JP1.

For information only (to complete the circuit description): the heater voltage is fed via JP1 to the soldering pad marked "COM", in parallel to both sockets. Then it is returned via a smaller wire, for feedback monitoring, to the point marked "htrvmi via a smaller 4-contact connector (JP2 - contact 4). It continues through the cable harness to the INTERFACE PCB for monitioring. The tubes nominal heater voltage and current is 12.6V/2x3.6A.

Please inform me about the results of your inspection. Of course, additional information is available as needed.

P.S.

I'm sorry, it seems that we missed your previous message. Yes, I'll certainly send the CD by air mail and free of charge for you. Please tell me your exact address where I have to mail it.

About the tubes estimated life and warranty period. Yes, Svetlana warrants this tube for 5000 hours or 2 years (class "B" Svetlana's Warranty, i.e. first 500 hours - full replacement, the rest period - prorated). This warranty would be valid for you if you buy spare tubes from Svetlana.

We use an one-year period of full tubes warranty to our users. It is defined by our experience and by the estimated tubes life (that is a technical parameter of the tube but not a trade warranty). This parameter is not discussed in the Svetlana's document, so the 1000 hours/-10% information is found from different russian reference books. As we said, you can expect at least twice longer period for -10% deterioration and much more for functional faults.

Best 73's Vasco, LZ1JK Sofia, 5 February 2001.

Just wanted to report back to those on the newsgroup who gave me tips about the "G2 Low grid voltage" error I was having.

My amp was shutting down with the above error. Various suggestions (which included checking/replacing the Molex connectors, replacing the IRF voltage regulator, replacing the varistor on the Pa grids) proved unsuccessful.

Last week I shipped the amp to Krassy, and it's on its way back to me already.

Cause of problem turned out to be stretched & sometimes intermittent leads in the RS232 cable to the control head. In fact I believe I replaced the serial connector about a year ago so my problem very likely was a self-inflicted wound.

As usual, there was no charge for repair, and my amp was given extremely fast turnaround with great communication and information. I've owned lots of gear and brands over the years and have never seen such great service and attention to customer satisfaction. Thanks Krassy!

I ordered a 2000A and should see it mid July-2001
questions:
1. does the RCU use shielded cable?
2. should the ptt line use shielded cable?
3. I read some comments about TVI...anything new on this topic?
4. I will be using an IC-775dsp and a Sommer XP707 log/beam 10-40 meters...I read about some spiking problems with the ICOM I bought my ICOM around March 2000 so am I in for any surprises??? I am currently using an Ameritron AL-80A with no problems.

for those of you with rfi in the shack look into the radio works T-4 isolators, also use double shielded cable for audio and maybe look at RG-214 double shielded coax inside...

Regards and I'm excited to locate and get onto this group

Ok, last call. How about $375 for the switch/controller plus shipping.
Its surplus to my needs and is in excellent condition. I was using it
in my remote controlled station which has been dismantled. We're moving
out to the country soon and I'll get to put a tower up in the back yard
again.

I have a similar setup.
What is the serial # on your 775? If it is a late one you should have no problem although you have to turn the "drive" down to have it working flawless. (this is my 3rd 775 before the thing was working correct.

I've been wanting to make this post for a long time, but it's been left on the back burner until you guys brought this subject up and lit a fire under me to finally do it ...

I had horrible problems with my Icom IC-775DSP and Acom 2000A working together. Here's the fix (TNX N2TK ES K3WW!):

1. Forget keying the amp from the transceiver's RELAY output. This signal switches too late for the amp. The RF gets there before the switch signal and the amp appropriately kicks out.

2. Instead, key the amp from the ACC jacks (DIN jacks). Pin 3 on ACC(1) and pin 3 on ACC(2) are identical and either should do the trick. Connect directly to the amplifier's KEY IN jack. No extra relay or other switching device is necessary. In fact, it could provide enough delay to the signal to perpetuate the problem, or maybe even make it worse.

The ACC signals are taken off an earlier circuit in the switching path and is thus, ever so slightly ahead of the RELAY output. This switching problem is also seen in the Alpha 87A. Manual amps lack the smarts to complain about this. I can't imagine it's good for the amp.

Since making this change, my 775/2000A combo has been spectacular. Fiddling with the drive control is MUCH less sensitive. I think it's prudent to take this opportunity to publicly chastise Icom for their lousy response to this situation. Of course, I could count on my FRC brethren to come though when Icom refused to acknowledge the problem, much less suggest a fix. You guys are the best!

Anyone attempting to use an Icom IC-775DSP with an Acom 2000A or Alpha 87A should know about this.

Same applies to the Ten-Tec Omni 6 Plus --- Do not use the tx relay out --
You must use the Omni TX Out/TX EN connected together with a "Y" connector,
with the free end of the "Y" connected to the 2000A Key In Jack.

The Mark V and FT-990 TX Relay out works fine with my 2000A in all modes.

To configure this interface correctly, a small-signal steering diode (e.g., 1N914 or 1N4148) should be used to isolate the Omni's pull-up voltage at TX OUT and the ACOM/Alpha key line. The diode's cathode end should face the Omni Six end of the RCA "Y" adapter. This arrangement should only be used with the ACOM and Alpha 87A amplifiers; it will not work on amplifiers that do not protect against hot-switching nor amplifiers that use a high-voltage/high-current key line.

Also, the ACOM may support Ten-Tec's sequenced switching. There was a post some time ago from someone who successfully used the Omni's separate TX OUT/TX EN jacks to the ACOM 2000A.

545. Stamp-based amp+switch controller progress

Yahoo group: acom-list (1999 — 2009)
Date: 2001-07-03 13:15:52 UTC
From: n8wrl@arrl.net
Topic: 545 Message: 545

Hi all!

Just an FYI to let you know I'm about 80% done with a Basic Stamp-based controller for the amplifier and switch. The basic idea is to track band changes from my FT990 and send tuning commands to the amplifier and selection commands to the switch automagically.

There are already 'band-data decoders' out there that translate the 4-bit Yaesu band data into an antenna selection, but I wanted something that could be programmed with more than one antenna for a band and remember the one I used last, as well as let me switch to the others. It also lets me switch thru antennas that aren't for the band I'm on, but in that case it opens the tx-inhibit line to prevent me from making a boo-boo.

There is a two-line LCD that displays the band the radio is on and the selected antenna (in words - I'm too dumb to remember the numbers). When I change antennas from the up/down buttons or the radio changes bands that requires an antenna change, a 'change antenna' serial command is sent to the antenna switch.

I say I'm 80% there because the amplifier-side is the next thing to do. I've had some very good email chats with Vasco at the factory about the 2000A's behavior with antenna selection. The bottom line is a simple antenna change command won't be enough because even with 'auto antenna change off' antenna changes sent via serial commands don't 'stick' - the amp still remembers the last antenna you used for a given segment and changes to it. This is not the case if you make the antenna chnage via the RCU. Vasco sent me some suggestions I have yet to try, so I'll keep you posted.

Anyway, that's where I am. Just curious if anyone has any thoughts or ideas on what they'd like to see a gizmo like this do.

73!

546. SO2R Amplifier Swapping

Yahoo group: acom-list (1999 — 2009)
Date: 2001-07-04 01:10:14 UTC
From: Glenn O'Donnell
Topic: 546 Message: 546

Brian (and everyone else),

I am finally sending this out in response to the dialogue below. WAY back in April, we were discussing the pending amplifier swapper from Acom. As I understand it, this device would allow the use of a single amplifier in SO2R operation.

In my continuing build-out of my SO2R station, I came up with a design of my own. I haven't yet built it (NO TIME!), but my design is on my web site (http://www.qsl.net/k3pp/ampswap.gif). This is a very simple design. It's just a few relays with a control signal. Some notes on my design:

Basically, you simply hook up as shown and apply a +12v signal to the MULT input when you want to put the amplifier on the Multiplier radio. Otherwise, the Run radio always has the amp. Both radios are always connected to their respective antennas. The only difference is the placement of the amplifier. Proper station design still requires external filters and appropriate antenna switching. I plan to use a WX0B Six-Pak with mine. The Six-Pak is in and it should make for an easy hookup.

I show a point in the circuit called RELAY COMMON. This is shown connected to ground for the +12v MULT signal. If you use a "switch to ground" signal to activate the Multiplier radio, then this RELAY COMMON point shout be tied to +12v instead.

Obviously, this circuit is not very practical with manual-tune amplifiers. SO2R with one amp requires an amp that will quickly switch bands and retune. Otherwise, what's the point? HI! We spent big bucks on our Acom 2000A amps (and Alpha 87As too) to get this worry-free operation to shave time off our operating.

I'd rather buy than build at this point in my busy life, so if someone from Acom has news on the commercial unit, please let me (and the rest) know.

Hi Glenn,

This is fine for a single band or at most two bands. How does it handle multi-band operations? Is the band data output of each rig selecting the proper antennas first? Then there is the keyer, mike and audio to also switch..... I suppose you have another box for that.

I have been playing around with BASIC stamps for station control here and suspect they would the the easiest way to SO2R--including swapping the amp. Right now the stamp (actually two stamps) here handles all the normal and alternate antenna switching as well as an LCD readout of transmit and rx antennas.

I have it working so that the normal antenna is switched with the bcd band data. Flipping a single switch (regardless of band) attaches the alternate antenna. This may mean figuring out that to get to the alternate 10m antenna that one must:

1) open the quad coax link
2) switch to the 40M tower coax
3) apply the correct RCS8 voltage to get the antenna selected
4) switch in the top/bottom/stack circuitry....

This is all quite easy with a programable chip.

What is missing and what N8RWL is working on is how to tell the ACOM amp to know that the alternate antenna needs a different set of tuning's (i.e antenna #) for that band/freq segment.

I hope the N8RWL is successful so that we can build that function in as well.

One theoretical question to consider for the SO2R/one amp
approach:
Suppose you make 20 QSOs/hour on radio 2. That's 40 band
changes per hour, and almost 2000 in 48 hours. Do you think that
might lead to premature failure of the tuning servos/motors?

It might be better in the long run to pick up a cheap amp for the run
radio, as there won't be many band changes, and use the Acom
with the mult radio.

I believe Acom is working on something like this in conjunction with
N3RD/N3RS so the amp will know in advance which setting to
select for partial stacks.

Brian,

Here is an off the wall idea. If the ant switch box successfully
makes the antenna selection "sticky", perhaps you ought to identify
your stamp as a antenna switch box instead of a pc controller. I
think there have hex Id's in the 50 to 5F range. It may be that there
is some check in the ACOM amp requiring antennas only be selected by
switch boxes.

Hi guys!

I've got the 'control the amp' part on the run. With help from Vasco at Acom, I think the strategy is to tell the amp what the last antenna used on a segment is, before the radio tries to xmit there. A little background...

I was hoping that by turning auto-antenna changing off on the amp I could just tell it to go to an antenna with the same command as the switch. After all, if you make a manual antenna change via the RCU it 'sticks' and the amp will stay on that antenna no matter what frequency you xmit with. Trouble is, it doesn't work that way when the command comes from the serial port (like the antenna switch or pc commands). Vasco sent me an example where I can run thru the segments in a band and tell the amp to set the 'last antenna used' for each segment to the one I want. That way, when the rig xmits the amp still does its 'last antenna used' switching and ends up on the antenna you want.

The puzzle this morning was encoding the segment number - it is an ascii-ized version of the hexadecimal representation of the segment number. Whew! I'll upload a spreadsheet listing the codes for all the segments on the amateur bands.

Topic: 539 Message: 552

For Marty:

1. The RCU is equipped with a shielded cable, 3 meters (9.8 feet) long. Besides the standard cable, a 10 meters (32.8 feet) extender is optional.

2. You'll have to use a shielded cable for the PTT too. It must be ended on a RCA "Phono" type connector to the amplifier side (KEY-IN). Please note sections 2-4(d),(e) of the operating manual for installation details.

3. We have no complaints about TVI. Anyway, the FCC spurious emissions requirements for first 10 harmonics are exceeded to 5-20dB for all bands (the higher the harmonic number, the higher the margin). In fact, only harmonic frequency emissions were noted. In addition, investigations above 300 and up to 2000MHz have been performed in ACOM's laboratory, with excellent results.

4. Some transceivers generate a high peak at the very beginning of each transmission. Normally, the spikes are as higher-level, as longer the pause after last transmission is.

You may check your transceiver for spikes generation using an external wattmeter with a "Peak & Hold" function, or an oscilloscope, or just the peak-reading LED-bar power indicator of the ACOM2000A amplifier. Reduce the drive for about 1/5-1/4 of the nominal power. Wait for about 1 minute without transmitting to let the ALC system to settle, then look for the output at the very beginning of the transmission. The difference between the first transmitted peak, and the settled power (about one-second later) will be a good indication for eventual spikes from the transceiver, and how many times higher they are above the value you set.

The amplifier is conformed with bearing such spikes for up to 20 milliseconds duration. You may overcome longer and/or very high peaks using any of the following tips:

a) Use lower MIC gain when Speech Processor in SSB mode is ON.

b) Limit the transceiver's PEP output to about 50-60W via any method foreseen by the producer: for instance, FT1000MP has this possibility via menu selections.

c) Bias externally the ALC input of the transceiver to limit its PEP output. Feed a constant voltage to the transceiver's ALC input from a DC source (preferably regulated). You may use a battery plus a potentiometer too.

From: dick.green@valley.net
Topic: 546 Message: 553

Glenn,

It's a nice design, but it won't really work for SO2R. I tried a similar circuit with my 87A and the problem is that the amp takes too long to change bands. When you switch back and forth between the run radio and the S&P radio, the amp just can't keep up. In the case of the 87A, a significant portion of the CQ, callsign or exchange is transmitted at low power while the amp is retuning. In the case of the 2000A, there is no transmission at all until the amp finishes tuning (more on this below.)

I'm specifically referring to automatic SO2R switching as done by the WriteLog and NA contest programs. Both packages allow you to start a CQ on the run radio, then hit a function key to send your call on the second radio. When this happens, the CQ is stopped, the contest program switches to the second radio and sends your call, then the CQ is restarted on the first radio. You can do this manually as well, which is the only way to do it in CT. Regardless of whether the switching is automatic or manual, the amp won't retune fast enough when the QSO rate is high. You can start each message buffer with a dit ("e") followed by a pause, but this slows down the QSO rate and can cause confusion.

Unfortunately, there's no good solution short of using two amps. Even if your contesting software "pre-tunes" the amp to the operating frequency (i.e., retunes on band changes during receive), the switching between radios is still too slow.

Now, about that little problem with the ACOM suppressing transmission. I discovered this during the CQWPX CW contest. I noticed that when I changed bands and sent a function key message, the first couple of characters were not being transmitted. To avoid this, I had to switch to the second radio and hit a dit every time I changed bands. After the contest, I discovered that the ACOM holds the KEY OUT line high until the retuning is completed. Thus, my 1000mp was inhibited from transmitting during retuning. Unfortunately, it doesn't help to configure the 1000mp and ACOM without the KEY OUT line (which is perfectly safe, even for QSK, due to safeguards in both the rig and amp.) In this case, the amp redirects the input RF into a 50-ohm resistor. I confirmed all this with Vasco at the factory. So, there's no solution short of remembering to hit that dit (a pain) or programming a dit and delay into the messages (not practical for high-speed operation.)

Again, the 87A is designed to pass the input RF to the antenna during retuning. I guess this is much easier to do with PIN diodes than a

vacuum relay.

554. Stamp-antenna switch WORKS!

Yahoo group: acom-list (1999 — 2009)

Eureka!

With help from Stan, LZ1IU at ACOM I got the basic stamp-based antenna switch working like a charm. Very cool. I reworked the 'protocol' to talk to the amp so that much less motor activity is involved in a band or antenna change. Basically, I leave the amplifier in 'auto change mode' and all the 'chatty serial' comms enabled. Each time it makes a band or antenna change, the amp announces its 'intention'. I monitor for this and when I see one, I check to see if it is on the band I want and the antenna I want. If not, a quick serial command corrects it, all in the time of a 'dit' for tuning!

From: n8wrl@arrl.net
Topic: 555 Message: 555

Hi all!

After finishing a station reorg, I've noticed some weird behavior from my 2000S antenna switch controller. I'm not sure how long it has been this way...

I'm trying to get the tx-in/tx-out loop reconnected:

Radio's TX-GND -> Amp's TX-IN
Amp's TX-OUT -> 2000S TX-IN
2000S TX-OUT -> Radio's TX-INH (FT990's LINEAR)

I think the switch is leaving tx-in/tx-out open when it is on! Here's what I've found:

When the switch is powered off, I measure 81 k-ohms across tx-in/tx-out. When the switch is powered on, even with the little 'pip' next to the antenna number display lit, I measure an open circuit.

The amplifier seems fine - tx-in/tx-out measures very low resistence at the right times. I currently have the loop connected like this with no problems:

Radio's TX-GND -> Amp's TX-IN
Amp's TX-OUT -> Radio's TX-INH (FT990's LINEAR)

The switch controller also gets pretty warm, and hums noticably. Anybody have any ideas? Does it need a trip back to ACOM?

73!

No, the switch box would not be needed at all. I have it
on a seperate serial line so the amp never even sees it.
You could easily output the 4 bits the switch wants w/o
the controller. I just sent the serial commands because
it was easy.

It is operating properly -- I spoke to Krassy about it some months ago ---

Take the case off the control box - that will get rid of the hum. I put a
foam rubber pad between the case and the top of the transformer module, this
helps a bit.
The hum is caused by the steel cover reacting with the stepdown transformer.
The heat is caused by the power supply.

My Amp has been operating flawlessly for over a year now -- I ran it hard for
a couple of RTTY contests -- no problems at all running 1.5kw out on RTTY

Thanks for the reply, Bill!

I'll try those tips re the heat and hum.

Would you mind taking an ohmmeter to your tx-in/tx-out
ports? I'm interested in what you measure when the unit
is off and when it is on and 'thinks' everything is ok
(completed the selection, etc.) I measured mine with the
red lead of my ohmmeter connected to the center of the
tx-in RCA jack, black to tx-out.

Thanks!

Hi Brian. Wondering where I can find info on the stamp-antenna switch. I have an Acom 2000A. Been thinking about getting their antenna switch, but am waiting till they have an alphanumeric readout on the control box. Also want to be able to have automatic antenna selection with the amp off.
Tnx. 73

I'm writing up an article now. Not sure how applicable
it would be to the 'masses'. I think it is adaptable to
virtually any antenna switch, but the amp control is
pretty ACOM-specific. Right now I send serial commands
to the switch but there's no reason a different
interface couldn't be used - BCD lines, etc.

562. Anticipation! of 2000A shipping to me.

Yahoo group: acom-list (1999 — 2009)
Date: 2001-07-13 13:35:09 UTC
From: ka7gkn@arrl.net
Topic: 562 Message: 562

This comming week I think is when my 2000a will be shipped. I can't wait!
As I read the recent postings regarding the software and hardware for antenna switching, I wonder how many users use a manual switch to select other antennas or rigs to interface with the 2000a?

I plan to use a dawia CS-201 2 position switch to select between my FT990 and IC775....My primary rig being the IC775 will be in line 99% of the time and I have an Alpha Delta switch to select between the vertical, dummy load, and Sommer log beam. The log will also be in line 99% of the time.

Hmmm after 22 years in the high tech world of medical electronics, I seem to have no difficulty in manually selecting an antenna...I guess my analog is showing ha ha ..

Speaking of the 2000a ...how long is the power cord and what gauge is it?

see ya all later, Marty

Well this weekend I played IARU, which was my first contest entry with the 2000A. What a difference! I've never had an amp before, and it really made the contest more enjoyable for me. I consistently, and often, got comments on the audio quality, the signal strength, etc. "You're booming in", "Great signal!", "One of the loudest I've heard" ... all came unsolicited. Neat!

The switch controller was a big help too.

FYI,
Acom has updated their Web site with more on the 1000A, as well
as Digital audio recorder/memory keyer.

I'd really like to see the long-overdue controller software...

570. Gain vs freq

Yahoo group: acom-list (1999 — 2009)
Date: 2001-08-02 12:18:32 UTC
From: alsopb
Topic: 570 Message: 570

Guys,

I was wondering how your gain vs freq curves for the ACOM-2000A look.

I usually expect gain to fall off at higher freq's. Here is what I measured. All measurements are from ACOM digital readout.

freq fwd ref drive gain
3.5 1.50kw 7w 59 14.0db
7 1.50 26 53 14.5
14 1.50 11 51 14.5
21 1.50 39 50 15.0
28 1.50 31 38 16.0

The amp was "autotuned" first at each freq.

The concern is a possible oscillation -- although no power output appears with the amp at xmit and no drive. Not possible to perform the ususal test of slewing tune/load controls and look for output..

> The amp was "autotuned" first at each freq.
>
> The concern is a possible oscillation

As I recall, my ACOM amplifier gain figures were similar. On my Alpha 87A, the gain is flat on all bands. However, I never validated the drive power against another known reference. This would be a good test to ensure that the ACOM's drive power display is reasonably accurate.

Has anyone experienced a tube failure or burned parasitic resistor as a result of a parasitic oscillation?

Hi all!

I just realized I don't have any kind of surge suppression protection for the amp! 110v models grow on trees, but I don't recall seeing any surge suppression products for 220v. Anyone know of any?

73!

The best thing is to put one in your circuit breaker panel. They mount in one of the 1/2" knock-outs on the side of the panel and wire in either on an individual circuit breaker (like you'd want to do here) or on the main circuit breaker to protect your whole house.

240v +/- 10% (216v to 264v) (which it really is in most places in the U.S. rather than 220) is two 120v "legs" of the transformer out on the pole somewhere. You could build your own out of the parts two 120v suppressors and install them in a suitable box with a 240v 20A jack on it.

```
Pole Transformer Secondary
^^^^^^^|^^^^^^^
| | |
Ground
120v 0v 120v
|---- 240v -----|
```

I hope this "picture" helps explain it.

Brian,

Talk to a licensed electrical contractor. There are several options for 240 volt suppressors. My surge suppressor is located at the house main electric panel, installed after the utility pole transformer took a direct lightning hit. We live on a ridge 700 feet elevation above Fairbanks. We were without power for several hours until the utility replaced the transformer primary side fuse. The only casualty was a circuit card in one of several outdoor sensor lights that was burned up- looked like burned toast. At the time, the rig was turned off. Antennas are located on a tower, grounded per NEC (National Electric Code) located about 100 feet from the power pole. The several antennas are 40 to 60 feet higher than the lighting struck transformer and were all grounded via a antenna selector switch which was switched to the dummy load, where it is set when not operating. The Acom 2000A was connected to 240 volt power and turned off. The rig was also grounded via #6 bare copper connected to every piece of equipment, including a coax lightning arrestor, connected to a 8' ground rod located within 5 feet of the rig. Other than the one item "toasted" we suffered no damage, considered ourselves very fortunate, and immediately added the surge protection to the electric service. I do not know whether or not the tower and antennas took any of the lightning hit, however induced voltages on antennas and their leads to the rig must have been pretty severe owing to the location of the tower near the power pole that did take the hit. The lightning stroke was witnessed by two men working on the roof of the house, who promptly got off the roof.

I also had a contractor install a supressor at the service entrance at the in-law's house in the hill country of Ashe County, NC about 10 years ago. They had experienced several well pump failures during thunderstorms before installing the supressor. They have experienced no equipment failures since then, although they once had to replace the supressor which failed after the power line took a lightning hit- it did its job as no other equipment failed.

Best wishes,

Jim Movius, KL7JM

Hi Brian and group here is information on 220/240vac filters:

Industrial Communications Engineers ltd aka I.C.E. 1-800-423-2666
order direct or via Array Solutions 972-203-8810 [Sharon or Jay]
they talk tech over the phone I.C.E. has no operational website right
now it's being repaired

I ordered the model 330 ac mains impulse suppressor, noise and rf
filter $ 58.00 120-0-120 single phase wires direct into breaker panel
[easy] protects entire distribution system. size 1 1/2x3x3"
burst proof heavy shielded box

other options:
model 338 in line protector for delicate equipment single outler nema
6-20r receptical 6 foot #12 cord you supply plug 240vac 25 amp $76.00
2 1/2 x4x4"

model 477 $68.00 similar to the model 338 but not too sure about
specific differences.

according to I.C.E. first choice is 330 then 338 then 477

I have their 302u and 303u lightning and emp supressor. these gadgets
actually reduce receiver hash/noise by acting as a drain on the coax
it works and really slick! also have a 348 rotator transient
supressor anf rf filter for my tailtwister unit

they have a myriad of other switches and filters great catalog

all are made in usa and have a 3 year warranty

hope this helps

578. still waiting for my 2000a

Yahoo group: acom-list (1999 — 2009)
Date: 2001-08-17 14:24:41 UTC
From: ka7gkn@arrl.net
Topic: 578 Message: 578

Well group, I am still waiting for the 2000A to ship to me that I ordered during Dayton. Lots of delays. I'd like to hear from those that have received their amps recently, say, since Dayton to get their comments and installation techniques from type rigs used to where the box is located. Any rfi problems etc.

I have spoken to Krassy and he is sincere in his apology for the delay and I accept, since I'd rather wait then get a unit rushed through production and testing just to meet a deadline!

I have ordered the #330 ac power mains impulse supressor,noise & rf filter from I.C.E. 1-800-423-2666 around 58 bucks american plus shipping. this unit will fit in the main breaker box in my home and protect "everything" ---so they claim--- this way I won't need a seperate 220vac surge, spike etc etc protector...but if that's only what you want they have those too. model 338 and 477. When I receive this item I'll write comments on it.

Keep the interesting tech comments and reviews coming. by the way the reviews on Eham.net are getting old. How about some fresh reviews?

Any of you using this amp with a Sommer antenna? Say the XP707 or XP807?? I am interested to know how the amp handles the 40 meter capacitive load [swr] My XP707 swr on 40 meters is 2.5:1 and its capacitive in nature. I'm unable [at this time] to adjust the 40 meter system to reduce the swr to 1.7:1

keep in touch regards...Marty in Glendale Az. ka7gkn@...

579. Re: [acom-list] still waiting for my 2000a

I waited a while for mine (ordered last fall - arrived xmas-time-ish). Apparently the limited production gets targeted for areas, or so it seems. When I was waiting, Europe was hot. Then Krassy got ten units or so and one was mine. I was of the same feeling - don't rush the production or the QA. Now that I have it, it has operated flawlessly and I'm glad I didn't push. Krassy was very forthcoming as to where the delays were and what the story was. He was great when the unit arrived - insisting on being on the phone with me during the installation to steer me clear of common problems, etc. It was really so simple I don't think he needed to do that, but it was appreciated.

I recently ordered one of the ICE units also - the 338 I think so I don't have to get into the breaker box. I have a seperate box for my shack and the amp is on the only 220 line, so it seemed half-of-one...

The amp seems to handle SWR loads as high as 3:1 - it gets a workout on the edges of my 40m beam (Cushcraft XM240). It doesn't complain but it is a bit unnerving to see the high reflected power on the LED's. Good reminder to lower the exciter power a bit. So if you can, make the adjustments now.

I've been working with the automatic switch controller project I did a while and really like it. I'm probably going to make a tweak or two to the software and write up an article. Did you get the switch too?

Good luck, and hang in there - you'll be very pleased with the amp.

73!

580. N8WRL switch update

Yahoo group: acom-list (1999 — 2009)
Date: 2001-08-19 22:08:23 UTC
From: Brian, N8WRL
Topic: 580 Message: 580

Well, I couldn't stand it any longer - I had to tweak the way my BASIC-Stamp-based switch controller interacts with the amplifier on a band change.

Consider this scenario:

* You're on 20CW cq-ing away. You see a spot for a mult on 10 so you QSY
* When you key up on 10 the amp 'announces' it is tuning for 10m and the antenna it will be using. The controller sees this and checks the amp's antenna choice and sends a 'W3' command to correct it if necessary (you may have been on a different antenna the last time you were on 10).
* After working the mult, you go back to 20 ready to resume your run. The antenna switch changes back to the antenna you were last using on 20, but the amp stays on 10! This isn't a big deal because the next time you key up the amplifier announces the tune again and the controller corrects the antenna, etc. But that means your first 'dit' will be 'lost in the tuning'.

I realized that when the amp makes these announcements it includes the tuning segment number it is on (subset of a band), so I can remember that for each band (10m, 20m, etc.).

Now, when you go back to 20 the controller realizes you've been on 20 before & remembers the amp segment # you were on. When it sends the 'change antenna' command to the 2000S, it also sends the appropriate command to the amp to put it back on the 20m segment you were last using, as well as the right antenna.

If you QSY to a band you haven't transmitted on before, only the antenna switch gets commands, leaving the amp alone. Not unitl you key up (causing the amp to tune & select a segment) does the controller remember the segment for a band.

I'm hoping to write more of this up soon if there's interest.

73!

-Brian

581. 2000A almost here!

Yahoo group: acom-list (1999 — 2009)

From: ka7gkn@arrl.net
Topic: 581 Message: 581

I have the UPS tracking info...do you realize this means within the next 5-7 days...RATS a holiday weekend...my 2000A will arrive! I dusted off it's anticipated location, all new 9913 coax runs to and from it have been constructed and roughly routed, also the ptt line, ground, and power lines are eagerly waiting.
I also installed the I.C.E. 330 house ac 120-0-120 mains impulse suppressor,noise &rf filter. it just fit into our old Zinsco [1966] vintage circuit breaker panel/box. I'm impressed with this unit.

Krassy chuckled as we spoke over the phone..for an aging woodstocker, I sounded like a kid anticipating the arrival of my first car ha ha ha

Krassy explained about the delay and again apologized for the long wait but he said once I have it in my station the delay will soon be forgotten. I guess he'll be correct. I enjoyed chatting with him on the phone.

So, the next listing from me will discuss the install and inital firing up of the amp....stay tuned.....Marty ka7gkn@...

the acom arrived in great shape tuesday afternoon. only the internal xfrm box was damaged the box failed from the wight but with the great packaging no equipment damage!!!!

it's larger than I expected so I need to remake the shelf support!!!
my question for the group...

I see two 220vac configurations

refer to the manual schematic at the mains control voltage selector.
there is 220 and then there is (220) ....which configuration is for usa 220 lines??????
I have the bars set at the (220) configuration and the heater led flashes I did not change the mains setting low,normal,high
I left it at "normal"

the circuit board labeling is confusing

looking inside, this unit is beautiful!!! oh, I also pushed in all connectors to ensure they were not loose from shipping

I guess within the next few days I'll have more questions and comments
thanks for your support...

regards, Marty ka7gkn@...

Marty,
No idea what the (220) is for. Maybe it's an alternate 220V tap?
Mine is set for 240V (my line voltage usually runs ~124/248).
The obvious question: Did you measure your line voltage? If it is in
the 220V range, I'd try the other 220 configuration. If above 230, try
the 240 tap.

Marty,

I agree with Barry. Set the voltage tap to match your measured line voltage. In my case, the measured line voltage is 248 VAC. I
set the internal jumper bar to 240 VAC. Then using the RCU, I selected "HIGH" on the filament voltage setting. As I recall, this
allows you +/- 5.0 VAC from the soft menu selection. I ended up with an amplifier setting of 245 VAC to match my 248 VAC mains.

VIA LZ1AF I ASKED THE ACOM CHEIF ENGINEER ABOUT THAT BRACKETED 220 VOLT SETTING AND WAS TOLD THAT IT WAS A SPARE. IT SHOULD NOT BE USED. 73, HARRY W3FM
Paul Christensen wrote:
Marty,

I agree with Barry. Set the voltage tap to match your measured line voltage. In my case, the measured line voltage is 248 VAC. I
set the internal jumper bar to 240 VAC. Then using the RCU, I selected "HIGH" on the filament voltage setting. As I recall, this
allows you +/- 5.0 VAC from the soft menu selection. I ended up with an amplifier setting of 245 VAC to match my 248 VAC mains.

From: ka7gkn@arrl.net
Topic: 587 Message: 587

I appreciate the rapid response to my question. yep I redid the mains jumpers looking at the schematic in the manual I am using the 220 set up on the lower left. The heater voltage is now 12.6 no flashing

I remade the shelf support used 3/4 oak plywood. I did use 3/8 and it sagged!!!! this box is heavy ha ha

I routed the cables from the amp but right now my station is a mish mash of coax since I have eliminated the AL-80A and the heath 2060A tuner. the amp seems to handle the Sommer XP707 antenna no problem
I do have a high swr on 40 meters and so far the only changes between 20 and 40 meters is adjusting the radio rf power output. the amp does not complain. the amp sits on top of a book case and is 5-6 feet from the operating position. plenty of cable for the remote unit. oh, a comment any way to dim the green backlight? the contrast is fine just that in my layout the green backlight is really bright.

I am surprised as to how quickly the amp tunes. I will send along more comments as I become more familiar with the box.
I do see the tube temperatures are pretty close both are running around 40-c or so.
regards....Marty ka7gkn@...

589. Re: dust cover....clever

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-07 13:37:56 UTC
From: alsopb
Topic: 589 Message: 589

Marty,

Here is a diagram of the dust flipper to keep room dust out of the amp
when its not operating.

```
...... .......
...... .......
.................................
.................................
.................................
.................................
.................................
```

The tabs are 1"x2.5" close to the edge of the rectangle.
The rectangular part is 4x7"

I just cut it out of regualar printer paper and used double sided foam
tape to attach the tabs to the side of the ACOM amp. There are 90
degree folds where the tab meets the rest of the part.

The airflow drives the paper almost completely out of the air stream.

You get the idea, I am sure.

590. MISCELLANEOUS OPERATING QUESTIONS

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-12 23:27:32 UTC
From: ka7gkn@arrl.net
Topic: 590 Message: 590

I am aware of the learning curve but let me ask some parameter questions to the group.
1. typical operating temperature range? I see 40-80c [104-140f]???
2. with swr at 1.1:1 on 40 meters via an ameritron atr-30 tuner I find 1-1.2kw max...not complaining just wondering. the tuner is required to accomodate the swr problem on 40 meters 2.7-3.1:1 and I do run 600-800 watts. But, with the tuner between the amp and the antenna I can do up to 1.2kw ....comments?
3. I made the dust flapper works ok I might try tissue paper to see if it will improve air flow with less resistance.
4. typical power to amp through my ic775-dsp is 40-55watts ...ok?
5. I encountered one prot alarm something with qsk and processor??? I reset all and no more problems.
6. I am using user defined auto tune with ease, the amp seems to mate well with the sommer xp707 10-40 log/multibamnd beam. I am unable to access the antenna to adjust the 40 meter coil about 3/16 of an inch!!! so I'm stuck with the high swr on 40.
7. I use external audio processing and no stray rfi in the shack the acom is a tight box!

thanks for all your input I really like this box
later.....Marty ka7gkn@...

591. Re: [acom-list] MISCELLANEOUS OPERATING QUESTIONS

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-13 02:14:38 UTC
From: Bob Naumann - N5NJ
Topic: 590 Message: 591

What do you mean "I find 1-1.2kw max." ?

Crank up the drive from your radio until you get 1500 out.

If you have low reflected power, there should be no problem getting full output.

592. Money Maker! (as seen on TV)

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-23 02:37:10 UTC
From: J J
Topic: 592 Message: 592

DO NOT DELETE IF YOU HAVEN'T READ THIS. THIS IS A ONE TIME MAILING.
This program is for real. And it works no matter which country you live in (read the testimonials at the end of this message). Read on and you will be convinced. It would only take 2 minutes.

Dear Friends & Future Millionaire:

AS SEEN ON NATIONAL TV:
Making over half million dollars every 4 to 5 months from your home for an investment of only $25 U.S. Dollars expense one time

Step by Step Instructions are enclosed to insure your success with this program. Please take the 2 minutes it takes to read this letter.

THANK'S TO THE COMPUTER AGE AND THE INTERNET !
==========

BE A MILLIONAIRE LIKE OTHERS WITHIN A YEAR!!!

Before you say ''Bull'', please read the following. This is the letter you have been hearing about on the news lately. Due to the popularity of this letter on the Internet, a national weekly news program recently devoted an entire show to the investigation of this program described below, to see if it really can make people money. The show also investigated whether or not the program was legal.

Their findings proved once and for all that there are ''absolutely NO Laws prohibiting the participation in the program and if people can -follow the simple instructions, they are bound to make some mega bucks with only $25 out of pocket cost''. DUE TO THE RECENT INCREASE OF POPULARITY & RESPECT THIS PROGRAM HAS ATTAINED, IT IS CURRENTLY WORKING BETTER THAN EVER.

You are supplying information for a small fee- People will request from you copies of all reports many times over. This is a cash business better than a Mc ee D.!!!!!
Each report will give you the information you will need to succeed.

This is what one had to say: '' Thanks to this profitable opportunity. I was approached many times before but each time I passed on it. I am so glad I finally joined just to see what one could expect in return for the minimal effort and money required. To my astonishment, I received total $610,470.00 in 21 weeks, with money still coming in''. Pam Hedland, Fort Lee, New Jersey.

==========

Here is another testimonial: ''' this program has been around for a long time but I never believed in it. But one day when I received this again in the mail I decided to gamble my $25 on it. I followed the simple instructions and walaa ..... 3 weeks later the money started to come in. First month I only made $240.00 but the next 2 months after that I made a total of $290,000.00. So far, in the past 8 months by re-entering the program, I have made over $710,000.00 and I am playing it again. The key to success in this program is to follow the simple steps and NOT change anything.'' More testimonials later but first,

========== PRINT THIS NOW FOR YOUR FUTURE REFERENCE ==========

$$$

===
Within a few days you will receive, vie e-mail, each
of the 5 reports from these 5 different individuals.
Save them on your computer so they will be accessible
for you to send to the 1,000's of people who will
order them from you. Also make a floppy of these
reports and keep it on your desk in case something
happen to your computer.

===
IMPORTANT __ DO NOT alter the names of the people who
are listed next to each report, or their sequence on
the list, in any way other than what is instructed
below in step '' 1 through 6 '' or you will lose out
on majority of your profits. Once you understand the
way this works, you will also see how it does not work
if you change it. Remember, this method has been
tested, and if you alter, it will NOT work !!! People
have tried to put their friends/relatives names on all
five thinking they could get all the money. But it
does not work this way. Believe us, we all have tried
to be greedy and then nothing happened. So Do Not try
to change anything other than what is instructed.
Because if you do, it will not work for you. Remember,
honesty reaps the reward!!!

1.... After you have ordered all 5 reports, take this
advertisement and REMOVE the name & address of the
person in REPORT # 5. This person has made it through
the cycle and is no doubt counting their fortune.

2.... Move the name & address in REPORT # 4 down TO
REPORT # 5.

3.... Move the name & address in REPORT # 3 down TO
REPORT # 4.

4.... Move the name & address in REPORT # 2 down TO
REPORT # 3.

5.... Move the name & address in REPORT # 1 down TO
REPORT # 2

6.... Insert YOUR name & address in the REPORT # 1
Position.

PLEASE MAKE SURE you copy every name & address
ACCURATELY!
==

**** Take this entire letter, with the modified list
of names, and save it on your computer. DO NOT MAKE
ANY OTHER CHANGES.

Save this on a disk as well just in case if you lose
any data. To assist you with marketing your business
on the internet, the 5 reports you purchase will
provide you with invaluable marketing information
which includes how to send bulk e-mails legally, where
to find thousands of free classified ads and much
more. There are 2 Primary methods to get this venture
going:
METHOD # 1: BY SENDING BULK E-MAIL LEGALLY
==========

Let's say that you decide to start small, just to see
how it goes, and we will assume You and those involved
send out only 5,000 e-mails each. Let's also assume
that the mailing receive only a 0.2% response (the
response could be much better but lets just say it is
only 0.2%. Also many people will send out hundreds of
thousands e-mails instead of only 5,000 each).
Continuing with this example, you send out only 5,000
e-mails.

With a 0.2% response, that is only 10 orders for
report # 1. Those 10 people responded by sending out
5,000 e-mail each for a total of 50,000. Out of those
50,000 e-mails only 0.2% responded with orders.

That's=100 people responded and ordered Report # 2.

Those 100 people mail out 5,000 e-mails each for a
total of 500,000 e-mails.
The 0.2% response to that is 1000 orders for Report #
3.

Those 1000 people send out 5,000 e-mails each for a
total of 5 million e-mails sent out.
The 0.2% response to that is 10,000 orders for Report
#4.

Those 10,000 people send out 5,000 e-mails each for a
total of 50,000,000 (50 million) e-mails.
The 0.2% response to that is 100,000 orders for Report
5
THAT'S 100,000 ORDERS TIMES $5 EACH=$500,000.00 (half
million).

Your total income in this example is: 1..... $50 +
2..... $500 + 3.....$5,000 + 4..... $50,000 + 5.....
$500,000 ..... Grand Total=$555,550.00

NUMBERS DO NOT LIE. GET A PENCIL & PAPER AND FIGURE
OUT THE WORST POSSIBLE RESPONSES AND NO MATTER HOW YOU
CALCULATE IT, YOU WILL STILL MAKE A LOT OF MONEY !

==========
REMEMBER FRIEND, THIS IS ASSUMING ONLY 10 PEOPLE
ORDERING OUT OF 5,000 YOU MAILED TO. Dare to think for
a moment what would happen if everyone or half or even
one 4th of those people mailed 100,000 e-mails each or
more? There are over 150 million people on the
Internet worldwide and counting. Believe me, many
people will do just that, and more!

METHOD # 2 : BY PLACING FREE ADS ON THE INTERNET
==========
Advertising on the net is very very inexpensive and
there are hundreds of FREE places to advertise.
Placing a lot of free ads on the Internet will easily
get a larger response. We strongly suggest you start
with Method # 1 and add METHOD # 2 as you go along.
For every $5 you receive, all you must
do is e-mail them the Report they ordered. That's it.
Always provide same day service on all orders.

This will guarantee that the e-mail they send out,
with your name and address on it, will be prompt
because they can not advertise until they receive the
report.

========== AVAILABLE
REPORTS==========

ORDER EACH REPORT BY ITS NUMBER & NAME ONLY. Notes:
Always send $5 cash (U.S. CURRENCY) for each Report.
Checks NOT accepted. Make sure the cash is concealed
by wrapping it in at least 2 sheets of paper. On one
of those sheets of paper, Write the NUMBER & the NAME
of the Report you are ordering, YOUR E-MAIL ADDRESS
and your name and postal address.

PLACE YOUR ORDER FOR THESE REPORTS NOW :
==========
REPORT # 1 : ''The Insider's Guide to Advertising for
Free on the Net''
Order Report # 1 from:

Teresita Santos
1-7 Row House Rawis
Don Bosco, Tondo Manila
Philippines 1012

REPORT # 2 : ''The Insider's Guide to Sending Bulk
e-mail on the Net''
Order Report # 2 from :

Bianca Elaine
c/o Joy Casanova
35 India St., Better Living Subd.
Paranaque City
Philippines 1711

REPORT # 3 : ''The Secret to Multilevel marketing on
the net''
Order Report # 3 from:

Kris H. Webber
Sankt Hansgade 24,3th.
Copenhagen 2200
Denmark

REPORT # 4 : ''How to become a millionaire utilizing
MLM & the Net''
Order Report # 4 from:

J Profit
P.O.Box 38333
Greensboro,NC 27438-8333
USA

REPORT # 5 : ''HOW TO SEND 1 MILLION E-MAILS FOR
FREE''
Order Report # 5 from:

Auralyn Joy
c/o Maximo L. Quijano
2262 Road 3
San Andres Bukid
Manila City
Philippines 1017

$$$$$$$$$ YOUR SUCCESS GUIDELINES $$$$$$$$$$$

Follow these guidelines to guarantee your success:

=== If you do not receive at least 10 orders for
Report #1 within 2 weeks, continue sending e-mails
until you do.

=== After you have received 10 orders, 2 to 3 weeks
after that you should receive 100 orders or more for
REPORT # 2. If you did not, continue advertising or
sending e-mails until you do.

=== Once you have received 100 or more orders for Report # 2, YOU CAN RELAX, because the system is already working for you, and the cash will continue to roll in ! THIS IS IMPORTANT TO REMEMBER: Every time your name is moved down on the list, you are placed in front of a different report.

You can KEEP TRACK of your PROGRESS by watching which report people are ordering from you. IF YOU WANT TO GENERATE MORE INCOME SEND ANOTHER BATCH OF E-MAILS AND START THE WHOLE PROCESS AGAIN. There is NO LIMIT to the income you can generate from this business !!!

==========

FOLLOWING IS A NOTE FROM THE ORIGINATOR OF THIS PROGRAM:
You have just received information that can give you financial freedom for the rest of your life, with NO RISK and JUST A LITTLE BIT OF EFFORT. You can make more money in the next few weeks and months than you have ever imagined.

Follow the program EXACTLY AS INSTRUCTED.
Do Not change it in anyway. It works exceedingly well as it is now. Remember to e-mail a copy of this exciting report after you have put your name and address in Report #1 and moved others to #2 .....# 5 as instructed above. One of the people you send this to may send out 100,000 or more e-mails and your name will be on every one of them. Remember though, the more you send out the more potential customers you will reach. So my friend, I have given you the ideas, information, materials and opportunity to become financially independent. IT IS UP TO YOU NOW!

========== MORE TESTIMONIALS==========

'' My name is Mitchell. My wife, Jody and I live in Chicago. I am an accountant with a major U.S. Corporation and I make pretty good money. When I received this program I grumbled to Jody about receiving ''junk mail''. I made fun of the whole thing, spouting my knowledge of the population and percentages involved. I ''knew'' it wouldn't work. Jody totally ignored my supposed intelligence and few days later she jumped in with both feet. I made merciless fun of her, and was ready to lay the old ''I told you so'' on her when the thing didn't work. Well, the laugh was on me! Within 3 weeks she had received 50 responses. Within the next 45 days she had received

total $ 147,200.00 ..... all cash! I was
shocked. I have joined Jody in her ''hobby''. Mitchell
Wolf M.D., Chicago, Illinois
==========
'' Not being the gambling type, it took me several
weeks to make up my mind to participate in this plan.
But conservative that I am, I decided that the initial
investment was so little that there was just no way
that I wouldn't get enough orders to at least get my
money back''. '' I was surprised when I found my
medium size post office box crammed with orders. I
made $319,210.00 in the first 12 weeks. The nice thing
about this deal is that it does not matter where
people live. There simply isn't a better investment
with a faster return and so big''. Dan Sondstrom,
Alberta, Canada
==========
'' I had received this program before. I deleted it,
but later I wondered if I should have given it a try.
Of course, I had no idea who to contact to get another
copy, so I had to wait until I was e-mailed again by
someone else.....11 months passed then it luckily
came again..... I did not delete this one! I made
more than $490,000 on my first try and all the money
came within 22 weeks''. Susan De Suza, New York, N.Y.
==========
'' It really is a great opportunity to make relatively
easy money with little cost to you. I followed the
simple instructions carefully and within 10 days the
money started to come in. My first month I made $
20,560.00 and by the end of third month my total cash
count was $ 362,840.00. Life is beautiful, Thanx to
internet''. Fred Dellaca, Westport, New Zealand

593. Money Maker! (as seen on TV)

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-23 02:37:28 UTC
From: J J
Topic: 592 Message: 593

DO NOT DELETE IF YOU HAVEN'T READ THIS. THIS IS A ONE TIME MAILING.
This program is for real. And it works no matter which country you live in (read the testimonials at the end of this message). Read on and you will be convinced. It would only take 2 minutes.

Dear Friends & Future Millionaire:

AS SEEN ON NATIONAL TV:
Making over half million dollars every 4 to 5 months from your home for an investment of only $25 U.S. Dollars expense one time

Step by Step Instructions are enclosed to insure your success with this program. Please take the 2 minutes it takes to read this letter.

THANK'S TO THE COMPUTER AGE AND THE INTERNET !
==========

BE A MILLIONAIRE LIKE OTHERS WITHIN A YEAR!!!

Before you say ''Bull'', please read the following. This is the letter you have been hearing about on the news lately. Due to the popularity of this letter on the Internet, a national weekly news program recently devoted an entire show to the investigation of this program described below, to see if it really can make people money. The show also investigated whether or not the program was legal.

Their findings proved once and for all that there are ''absolutely NO Laws prohibiting the participation in the program and if people can -follow the simple instructions, they are bound to make some mega bucks with only $25 out of pocket cost''. DUE TO THE RECENT INCREASE OF POPULARITY & RESPECT THIS PROGRAM HAS ATTAINED, IT IS CURRENTLY WORKING BETTER THAN EVER.

You are supplying information for a small fee- People will request from you copies of all reports many times over. This is a cash business better than a Mc ee D.!!!!!
Each report will give you the information you will need to succeed.

This is what one had to say: '' Thanks to this profitable opportunity. I was approached many times before but each time I passed on it. I am so glad I finally joined just to see what one could expect in return for the minimal effort and money required. To my astonishment, I received total $610,470.00 in 21 weeks, with money still coming in''. Pam Hedland, Fort Lee, New Jersey.

==========

Here is another testimonial: ''' this program has been around for a long time but I never believed in it. But one day when I received this again in the mail I decided to gamble my $25 on it. I followed the simple instructions and walaa ..... 3 weeks later the money started to come in. First month I only made $240.00 but the next 2 months after that I made a total of $290,000.00. So far, in the past 8 months by re-entering the program, I have made over $710,000.00 and I am playing it again. The key to success in this program is to follow the simple steps and NOT change anything.'' More testimonials later but first,

========== PRINT THIS NOW FOR YOUR FUTURE REFERENCE ==========

$$$

===
Within a few days you will receive, vie e-mail, each
of the 5 reports from these 5 different individuals.
Save them on your computer so they will be accessible
for you to send to the 1,000's of people who will
order them from you. Also make a floppy of these
reports and keep it on your desk in case something
happen to your computer.

===
IMPORTANT __ DO NOT alter the names of the people who
are listed next to each report, or their sequence on
the list, in any way other than what is instructed
below in step '' 1 through 6 '' or you will lose out
on majority of your profits. Once you understand the
way this works, you will also see how it does not work
if you change it. Remember, this method has been
tested, and if you alter, it will NOT work !!! People
have tried to put their friends/relatives names on all
five thinking they could get all the money. But it
does not work this way. Believe us, we all have tried
to be greedy and then nothing happened. So Do Not try
to change anything other than what is instructed.
Because if you do, it will not work for you. Remember,
honesty reaps the reward!!!

1.... After you have ordered all 5 reports, take this
advertisement and REMOVE the name & address of the
person in REPORT # 5. This person has made it through
the cycle and is no doubt counting their fortune.

2.... Move the name & address in REPORT # 4 down TO
REPORT # 5.

3.... Move the name & address in REPORT # 3 down TO
REPORT # 4.

4.... Move the name & address in REPORT # 2 down TO
REPORT # 3.

5.... Move the name & address in REPORT # 1 down TO
REPORT # 2

6.... Insert YOUR name & address in the REPORT # 1
Position.

PLEASE MAKE SURE you copy every name & address
ACCURATELY!
==

**** Take this entire letter, with the modified list
of names, and save it on your computer. DO NOT MAKE
ANY OTHER CHANGES.

Save this on a disk as well just in case if you lose
any data. To assist you with marketing your business
on the internet, the 5 reports you purchase will
provide you with invaluable marketing information
which includes how to send bulk e-mails legally, where
to find thousands of free classified ads and much
more. There are 2 Primary methods to get this venture
going:
METHOD # 1: BY SENDING BULK E-MAIL LEGALLY
==========

Let's say that you decide to start small, just to see
how it goes, and we will assume You and those involved
send out only 5,000 e-mails each. Let's also assume
that the mailing receive only a 0.2% response (the
response could be much better but lets just say it is
only 0.2%. Also many people will send out hundreds of
thousands e-mails instead of only 5,000 each).
Continuing with this example, you send out only 5,000
e-mails.

With a 0.2% response, that is only 10 orders for
report # 1. Those 10 people responded by sending out
5,000 e-mail each for a total of 50,000. Out of those
50,000 e-mails only 0.2% responded with orders.

That's=100 people responded and ordered Report # 2.

Those 100 people mail out 5,000 e-mails each for a
total of 500,000 e-mails.
The 0.2% response to that is 1000 orders for Report #
3.

Those 1000 people send out 5,000 e-mails each for a
total of 5 million e-mails sent out.
The 0.2% response to that is 10,000 orders for Report
#4.

Those 10,000 people send out 5,000 e-mails each for a
total of 50,000,000 (50 million) e-mails.
The 0.2% response to that is 100,000 orders for Report
5
THAT'S 100,000 ORDERS TIMES $5 EACH=$500,000.00 (half
million).

Your total income in this example is: 1..... $50 +
2..... $500 + 3.....$5,000 + 4..... $50,000 + 5.....
$500,000 ..... Grand Total=$555,550.00

NUMBERS DO NOT LIE. GET A PENCIL & PAPER AND FIGURE
OUT THE WORST POSSIBLE RESPONSES AND NO MATTER HOW YOU
CALCULATE IT, YOU WILL STILL MAKE A LOT OF MONEY !

==========
REMEMBER FRIEND, THIS IS ASSUMING ONLY 10 PEOPLE ORDERING OUT OF 5,000 YOU MAILED TO. Dare to think for a moment what would happen if everyone or half or even one 4th of those people mailed 100,000 e-mails each or more? There are over 150 million people on the Internet worldwide and counting. Believe me, many people will do just that, and more!

METHOD # 2 : BY PLACING FREE ADS ON THE INTERNET
==========
Advertising on the net is very very inexpensive and there are hundreds of FREE places to advertise. Placing a lot of free ads on the Internet will easily get a larger response. We strongly suggest you start with Method # 1 and add METHOD # 2 as you go along. For every $5 you receive, all you must do is e-mail them the Report they ordered. That's it. Always provide same day service on all orders.

This will guarantee that the e-mail they send out, with your name and address on it, will be prompt because they can not advertise until they receive the report.

========== AVAILABLE REPORTS==========

ORDER EACH REPORT BY ITS NUMBER & NAME ONLY. Notes: Always send $5 cash (U.S. CURRENCY) for each Report. Checks NOT accepted. Make sure the cash is concealed by wrapping it in at least 2 sheets of paper. On one of those sheets of paper, Write the NUMBER & the NAME of the Report you are ordering, YOUR E-MAIL ADDRESS and your name and postal address.

PLACE YOUR ORDER FOR THESE REPORTS NOW :
==========
REPORT # 1 : ''The Insider's Guide to Advertising for Free on the Net''
Order Report # 1 from:

Teresita Santos
1-7 Row House Rawis

REPORT # 5 : ''HOW TO SEND 1 MILLION E-MAILS FOR
FREE''
Order Report # 5 from:

Auralyn Joy
c/o Maximo L. Quijano
2262 Road 3
San Andres Bukid
Manila City
Philippines 1017

$$$$$$$$$ YOUR SUCCESS GUIDELINES $$$$$$$$$$$

Follow these guidelines to guarantee your success:

=== If you do not receive at least 10 orders for
Report #1 within 2 weeks, continue sending e-mails
until you do.

=== After you have received 10 orders, 2 to 3 weeks
after that you should receive 100 orders or more for
REPORT # 2. If you did not, continue advertising or
sending e-mails until you do.

=== Once you have received 100 or more orders for Report # 2, YOU CAN RELAX, because the system is already working for you, and the cash will continue to roll in ! THIS IS IMPORTANT TO REMEMBER: Every time your name is moved down on the list, you are placed in front of a different report.

You can KEEP TRACK of your PROGRESS by watching which report people are ordering from you. IF YOU WANT TO GENERATE MORE INCOME SEND ANOTHER BATCH OF E-MAILS AND START THE WHOLE PROCESS AGAIN. There is NO LIMIT to the income you can generate from this business !!!

==========

FOLLOWING IS A NOTE FROM THE ORIGINATOR OF THIS PROGRAM:
You have just received information that can give you financial freedom for the rest of your life, with NO RISK and JUST A LITTLE BIT OF EFFORT. You can make more money in the next few weeks and months than you have ever imagined.

Follow the program EXACTLY AS INSTRUCTED.
Do Not change it in anyway. It works exceedingly well as it is now. Remember to e-mail a copy of this exciting report after you have put your name and address in Report #1 and moved others to #2 .....# 5 as instructed above. One of the people you send this to may send out 100,000 or more e-mails and your name will be on every one of them. Remember though, the more you send out the more potential customers you will reach. So my friend, I have given you the ideas, information, materials and opportunity to become financially independent. IT IS UP TO YOU NOW!

'' My name is Mitchell. My wife, Jody and I live in Chicago. I am an accountant with a major U.S. Corporation and I make pretty good money. When I received this program I grumbled to Jody about receiving ''junk mail''. I made fun of the whole thing, spouting my knowledge of the population and percentages involved. I ''knew'' it wouldn't work. Jody totally ignored my supposed intelligence and few days later she jumped in with both feet. I made merciless fun of her, and was ready to lay the old ''I told you so'' on her when the thing didn't work. Well, the laugh was on me! Within 3 weeks she had received 50 responses. Within the next 45 days she had received

total $ 147,200.00 ..... all cash! I was
shocked. I have joined Jody in her ''hobby''. Mitchell
Wolf M.D., Chicago, Illinois
==========
'' Not being the gambling type, it took me several
weeks to make up my mind to participate in this plan.
But conservative that I am, I decided that the initial
investment was so little that there was just no way
that I wouldn't get enough orders to at least get my
money back''. '' I was surprised when I found my
medium size post office box crammed with orders. I
made $319,210.00 in the first 12 weeks. The nice thing
about this deal is that it does not matter where
people live. There simply isn't a better investment
with a faster return and so big''. Dan Sondstrom,
Alberta, Canada
==========
'' I had received this program before. I deleted it,
but later I wondered if I should have given it a try.
Of course, I had no idea who to contact to get another
copy, so I had to wait until I was e-mailed again by
someone else.....11 months passed then it luckily
came again..... I did not delete this one! I made
more than $490,000 on my first try and all the money
came within 22 weeks''. Susan De Suza, New York, N.Y.
==========
'' It really is a great opportunity to make relatively
easy money with little cost to you. I followed the
simple instructions carefully and within 10 days the
money started to come in. My first month I made $
20,560.00 and by the end of third month my total cash
count was $ 362,840.00. Life is beautiful, Thanx to
internet''. Fred Dellaca, Westport, New Zealand

595. Money Maker! (as seen on TV)

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-23 02:38:52 UTC
From: J J
Topic: 592 Message: 595

DO NOT DELETE IF YOU HAVEN'T READ THIS. THIS IS A ONE TIME MAILING.
This program is for real. And it works no matter which country you live in (read the testimonials at the end of this message). Read on and you will be convinced. It would only take 2 minutes.

Dear Friends & Future Millionaire:

AS SEEN ON NATIONAL TV:
Making over half million dollars every 4 to 5 months from your home for an investment of only $25 U.S. Dollars expense one time

Step by Step Instructions are enclosed to insure your success with this program. Please take the 2 minutes it takes to read this letter.

THANK'S TO THE COMPUTER AGE AND THE INTERNET !
==========

BE A MILLIONAIRE LIKE OTHERS WITHIN A YEAR!!!

Before you say ''Bull'', please read the following. This is the letter you have been hearing about on the news lately. Due to the popularity of this letter on the Internet, a national weekly news program recently devoted an entire show to the investigation of this program described below, to see if it really can make people money. The show also investigated whether or not the program was legal.

Their findings proved once and for all that there are ''absolutely NO Laws prohibiting the participation in the program and if people can -follow the simple instructions, they are bound to make some mega bucks with only $25 out of pocket cost''. DUE TO THE RECENT INCREASE OF POPULARITY & RESPECT THIS PROGRAM HAS ATTAINED, IT IS CURRENTLY WORKING BETTER THAN EVER.

You are supplying information for a small fee- People will request from you copies of all reports many times over. This is a cash business better than a Mc ee D.!!!!!
Each report will give you the information you will need to succeed.

This is what one had to say: '' Thanks to this profitable opportunity. I was approached many times before but each time I passed on it. I am so glad I finally joined just to see what one could expect in return for the minimal effort and money required. To my astonishment, I received total $610,470.00 in 21 weeks, with money still coming in''. Pam Hedland, Fort Lee, New Jersey.

==========

Here is another testimonial: ''' this program has been around for a long time but I never believed in it. But one day when I received this again in the mail I decided to gamble my $25 on it. I followed the simple instructions and walaa ..... 3 weeks later the money started to come in. First month I only made $240.00 but the next 2 months after that I made a total of $290,000.00. So far, in the past 8 months by re-entering the program, I have made over $710,000.00 and I am playing it again. The key to success in this program is to follow the simple steps and NOT change anything.'' More testimonials later but first,

========== PRINT THIS NOW FOR YOUR FUTURE REFERENCE ==========

$$$

===
Within a few days you will receive, vie e-mail, each
of the 5 reports from these 5 different individuals.
Save them on your computer so they will be accessible
for you to send to the 1,000's of people who will
order them from you. Also make a floppy of these
reports and keep it on your desk in case something
happen to your computer.

===
IMPORTANT __ DO NOT alter the names of the people who
are listed next to each report, or their sequence on
the list, in any way other than what is instructed
below in step '' 1 through 6 '' or you will lose out
on majority of your profits. Once you understand the
way this works, you will also see how it does not work
if you change it. Remember, this method has been
tested, and if you alter, it will NOT work !!! People
have tried to put their friends/relatives names on all
five thinking they could get all the money. But it
does not work this way. Believe us, we all have tried
to be greedy and then nothing happened. So Do Not try
to change anything other than what is instructed.
Because if you do, it will not work for you. Remember,
honesty reaps the reward!!!

1.... After you have ordered all 5 reports, take this
advertisement and REMOVE the name & address of the
person in REPORT # 5. This person has made it through
the cycle and is no doubt counting their fortune.

2.... Move the name & address in REPORT # 4 down TO
REPORT # 5.

3.... Move the name & address in REPORT # 3 down TO
REPORT # 4.

4.... Move the name & address in REPORT # 2 down TO
REPORT # 3.

5.... Move the name & address in REPORT # 1 down TO
REPORT # 2

6.... Insert YOUR name & address in the REPORT # 1
Position.

PLEASE MAKE SURE you copy every name & address
ACCURATELY!
==========

**** Take this entire letter, with the modified list
of names, and save it on your computer. DO NOT MAKE
ANY OTHER CHANGES.

Save this on a disk as well just in case if you lose
any data. To assist you with marketing your business
on the internet, the 5 reports you purchase will
provide you with invaluable marketing information
which includes how to send bulk e-mails legally, where
to find thousands of free classified ads and much
more. There are 2 Primary methods to get this venture
going:
METHOD # 1: BY SENDING BULK E-MAIL LEGALLY
==========

Let's say that you decide to start small, just to see
how it goes, and we will assume You and those involved
send out only 5,000 e-mails each. Let's also assume
that the mailing receive only a 0.2% response (the
response could be much better but lets just say it is
only 0.2%. Also many people will send out hundreds of
thousands e-mails instead of only 5,000 each).
Continuing with this example, you send out only 5,000
e-mails.

With a 0.2% response, that is only 10 orders for
report # 1. Those 10 people responded by sending out
5,000 e-mail each for a total of 50,000. Out of those
50,000 e-mails only 0.2% responded with orders.

That's=100 people responded and ordered Report # 2.

Those 100 people mail out 5,000 e-mails each for a
total of 500,000 e-mails.
The 0.2% response to that is 1000 orders for Report #
3.

Those 1000 people send out 5,000 e-mails each for a
total of 5 million e-mails sent out.
The 0.2% response to that is 10,000 orders for Report
#4.

Those 10,000 people send out 5,000 e-mails each for a
total of 50,000,000 (50 million) e-mails.
The 0.2% response to that is 100,000 orders for Report
5
THAT'S 100,000 ORDERS TIMES $5 EACH=$500,000.00 (half
million).

Your total income in this example is: 1..... $50 +
2..... $500 + 3.....$5,000 + 4..... $50,000 + 5.....
$500,000 ..... Grand Total=$555,550.00

NUMBERS DO NOT LIE. GET A PENCIL & PAPER AND FIGURE
OUT THE WORST POSSIBLE RESPONSES AND NO MATTER HOW YOU
CALCULATE IT, YOU WILL STILL MAKE A LOT OF MONEY !

==========
REMEMBER FRIEND, THIS IS ASSUMING ONLY 10 PEOPLE ORDERING OUT OF 5,000 YOU MAILED TO. Dare to think for a moment what would happen if everyone or half or even one 4th of those people mailed 100,000 e-mails each or more? There are over 150 million people on the Internet worldwide and counting. Believe me, many people will do just that, and more!

METHOD # 2 : BY PLACING FREE ADS ON THE INTERNET
==========
Advertising on the net is very very inexpensive and there are hundreds of FREE places to advertise. Placing a lot of free ads on the Internet will easily get a larger response. We strongly suggest you start with Method # 1 and add METHOD # 2 as you go along. For every $5 you receive, all you must do is e-mail them the Report they ordered. That's it. Always provide same day service on all orders.

This will guarantee that the e-mail they send out, with your name and address on it, will be prompt because they can not advertise until they receive the report.

========== AVAILABLE REPORTS==========

ORDER EACH REPORT BY ITS NUMBER & NAME ONLY. Notes: Always send $5 cash (U.S. CURRENCY) for each Report. Checks NOT accepted. Make sure the cash is concealed by wrapping it in at least 2 sheets of paper. On one of those sheets of paper, Write the NUMBER & the NAME of the Report you are ordering, YOUR E-MAIL ADDRESS and your name and postal address.

PLACE YOUR ORDER FOR THESE REPORTS NOW :

$$$$$$$$ YOUR SUCCESS GUIDELINES $$$$$$$$$$

Follow these guidelines to guarantee your success:

=== If you do not receive at least 10 orders for
Report #1 within 2 weeks, continue sending e-mails
until you do.

=== After you have received 10 orders, 2 to 3 weeks
after that you should receive 100 orders or more for
REPORT # 2. If you did not, continue advertising or
sending e-mails until you do.

=== Once you have received 100 or more orders for Report # 2, YOU CAN RELAX, because the system is already working for you, and the cash will continue to roll in ! THIS IS IMPORTANT TO REMEMBER: Every time your name is moved down on the list, you are placed in front of a different report.

You can KEEP TRACK of your PROGRESS by watching which report people are ordering from you. IF YOU WANT TO GENERATE MORE INCOME SEND ANOTHER BATCH OF E-MAILS AND START THE WHOLE PROCESS AGAIN. There is NO LIMIT to the income you can generate from this business !!!

==========

FOLLOWING IS A NOTE FROM THE ORIGINATOR OF THIS PROGRAM:
You have just received information that can give you financial freedom for the rest of your life, with NO RISK and JUST A LITTLE BIT OF EFFORT. You can make more money in the next few weeks and months than you have ever imagined.

Follow the program EXACTLY AS INSTRUCTED.
Do Not change it in anyway. It works exceedingly well as it is now. Remember to e-mail a copy of this exciting report after you have put your name and address in Report #1 and moved others to #2 .....# 5 as instructed above. One of the people you send this to may send out 100,000 or more e-mails and your name will be on every one of them. Remember though, the more you send out the more potential customers you will reach. So my friend, I have given you the ideas, information, materials and opportunity to become financially independent. IT IS UP TO YOU NOW!

598. Venting the tubes?

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-26 23:50:39 UTC
From: Barry
Topic: 598 Message: 598

Hi all,
Years ago, I recall seeing an Alpha amp that had been vented to outside the shack. I wonder if anyone has done something like this with the Acom? If so, I'd like to hear the specifics.
Also, if Krassy or Vasco read this and might comment - would putting a vent pipe over the outflow ports, without an additional fan, restrict airflow and cause the tube temps to rise too much?

And as long as I'm asking questions - any update on the software being worked on?

Tnx,
Barry

My amp is in a small room I build behind my operating desk where all the stuff I don't want in the shack goes - power supplies, UPS, computer, amp, etc. Temps build up a bit in there - not too bad, but I've been thinking about installing one of those bathroom-fan-vents or something. Ventilate the whole room since other things besides the amp generate heat.

I'd be a bit worried about putting a vent over the tube stacks themselves unless there was some sort of fan to help.

600. 2000A Remote Control, Cover & Tubes etc.

Yahoo group: acom-list (1999 — 2009)
Date: 2001-09-30 00:33:28 UTC
From: hal@AutoCutResearch.com
Topic: 600 Message: 600

I recently recieved my 2000A and I think it is great! It remotes better than any amp I have seen on the market with the little RCU. I have the amp down in the basement where it is always dry and cool. The shack on the third floor gets pretty warm at times. The ground wire is only about 2ft long to a stake outside. And I can forget about RF in the shack. I had ordered a 30ft extension cable with the amp which didn't come. So, after I saw that the cable was only an 8 conductor shielded with DB9s on the ends I just made an extension cable myself. Mlander said Krassy would return the money I paid for the extension. (Krassy was out of the country at the time.) Anyway, when I select MEASURE on the RCU menu it generates noise in the 2mtr rig. It's not a real problem but curious and wondered if anyone else has experienced that.

Also, when I removed the cover to install the transformer, three of the little nuts that are pressed into the chassis to accept the cover screws came out (actually two were already out). I don't think this in anyway reflects on the quality of the amp. Just the chassis maker didn't press them in good or something. But I wondered if anyone has had this happen and if there are any ideas on a good fix for this. It does't seem like enough to send it back for and the cover stays on fine :) But this is an excellent piece of equipment that I am proud of and I like everything to be just right.

Alex at http://www.qsl.net/kc0afx/tubes.htm quoted me a matched pair of 4CX800A tubes at $140 last month. I was thinking about getting them for spares. But unless you go to the trouble of changing them out as soon as you get them how do you know if they are ok until finally one day you need them? Anyway, with this well protected amp should spare tubes be anymore concern than any other part?

Hal, K4HW

Hal,

Good point about not knowing if the spare tubes are good, but it won't necessarily help to do a quick test. I put a new spare 3CX800A7 into my 87A a while back and after about 100 hours the tube developed a serious internal arc (probably a leaky seal.) You're better off using the original tubes for several hundred hours, then replacing them with the spares.

Unfortunately, amp protection isn't the issue with these tubes. It's more likely to be reliability of this, er, non-domestic product. I've heard mixed reports about that. Also, the 4CX800A tubes are subject to shipping damage. One of mine failed shortly after I put my new 2000A into service, with a failure code that suggested a screen grid short. Krassy speculated that the delicate screen had gotten jostled in shipping.

Finally, you can't just stick a new set of tubes in. The 2000A requires that the idling current be adjusted whenever the tubes are changed. You should be able to get a write-up about that procedure from Krassy.

Dick,

Thanks for your insight. I suppose you could get three that are matched then you would have a spare for the spare. Hopefully, these non-domestic tubes are good. The reports I have heard have been good.

Anyway, my experience with power tubes is limited to my time as a broadcast engineer about 30 years ago. We had transmitters of various power levels AM & FM that ran 24 hours a day and the tubes lasted for years. If I remember correctly we left the filaments on when the daytime stations shut down for the night. It was explained to me early on that the expansion and contraction from the heating & cooling of turning equipment on and off does more harm than leaving it on. It also insures that moisture is always driven out. So for 30 years I have adopted that philosophy and have had great success. The down side is vulnerability to lightning damage or other power surges is greater. So I try to take great care in that department. So far so good there as well. It is my hopes that this practice will also be of benefit to the 2000A and the tubes. It would be interesting to hear the experiences of others in this area.

603. 5-1 help running time of tubes?

Yahoo group: acom-list (1999 — 2009)
Date: 2001-10-03 15:20:31 UTC
From: ka7gkn@arrl.net
Topic: 603 Message: 603

In the help menu you have the running time of the tubes. for example:
000033h now what does that tell me? the number of hours I have
transmitted? -or- the number of hours power is applied to the
tubes? -or- the time the amp is powered up? and is that in minutes?
or in actual hours?
also just for you folks with older amps my amp shows above the
running time revision code 4.5
I guess that's the amp's software revision. I do not know
specifically what the older codes are and what the upgrades have been
but I guess in the scheme of things that's not important.
and finally, I have placed thin tissue paper over the tube chimneys
to reduce dust accumulation. when the amp is running the thin tissue
paper is blown out of the way allowing full cooling and air flow. I
see the tissue paper works better than thicker papers.

Thanks for your comments....Marty ka7gkn@...

Marty,

It would appear to be the time the amp is on even in standby mode. Seems that it would mean more if it was operating time. Wonder how that is reset when tubes are changed?

Or, for that matter...how does one change the tube serial numbers on the RCU display upon tube replacement?

You mean the amp isn't smart enough to read the serial number directly from the tubes? :.)
I guess there are lots of little programming "secrets" inside that amp, all of which can be set from the RCU, or maybe through the serial port.
BTW, I got the second amp in the US, almost 2 1/2 years ago, and my firmware is rev 3.3. I bought a second amp last year and it's rev 3.4, whatever that means.

Good questions all! Isn't there a service manual for the best amp in the world? I have been meaning to ask Krassy about that but haven't yet needed one. Its just that I like reading over such things to see how things are done. Besides, if you do need it, it's nice to already have it and be familiar with it. These things are a bit of trouble to ship. It's not like boxing up the 2 meter rig:-) And after all, we are hams.

Topic: 603 Message: 608

Hi Marty ,

Running time is the number of hours the heater is applied to the tubes. While you are using the OFF-MENU only the RCU is powered, so this time is excluded. The time is in actual hours but you may note that it indicates slightly less than the true.

The revision code (4.5) is concerned to the firmware of the amplifier. The first figure is for the RCU firmware and the second - for the CPU. No amplifier's function has been changed since the first release in 1998 (rev.2.2). Only minor improvements have been made, that do not concern the substantial amplifier's functions (text messages edition etc).

Krassy

609. run time = 46 hours

Yahoo group: acom-list (1999 — 2009)
Date: 2001-10-14 23:39:56 UTC
From: ka7gkn@arrl.net
Topic: 609 Message: 609

Boy you never realize how fast time flys. I have a run time of 46 hours already and I run anywhere from 500-1.5kw I just want the group to know this 2000A is a wonderful amp. No problems with the Icom IC-775DSP. It's nice to have all that extra head room and the ability to increase the power to 1.5kw when needed.

I often run through the measurementus when on the air and find it very helpful. It would, however, be very convenient if the fwd-pwr, rev-pwr and swr would have been in order instead of having to scroll to them.

I do have a tissue paper cover to keep the tube chimneys free of collecting dust. They pop up very easily and almost vertical when the amp is on and the fans is blowing. I do not see any problems with that. Typically idle temperatures runs around 30-40c and depending how long winded and the power out the temperatures can go to 90-100c I am not used to that amount of heat produced by an amp but my other unit was a single 3500z and it was not as hot.

Anyway I enjoy reading comments from this group....later,

Marty ka7gkn@...

611. Re:ACOM 1000-keying circuit

Yahoo group: acom-list (1999 — 2009)
Date: 2001-10-23 17:12:56 UTC
From: aa1nd@aol.com
Topic: 611 Message: 611

It was a few questions regarding the keying circuit for ACOM 1000.

The keying circuit requirements for the ACOM1000 amplifier are the same as for the ACOM2000A:

1. The antenna relay T/R control input of the amplifier is called "KEY-IN". When in OPERATE, on this input appears a DC signal which must be held to ground to activate the amplifier in transmit. This can be done via a relay contact or semiconductor (transistor or integrated circuit) with suitable polarity (positive to ground). The electrical specifications of the amplifier's input are: switching voltage (open circuit) minimum 12V, positive to ground; switching current (closed circuit) minimum 12mA; voltage drop or resistance @ 12mA current (closed circuit) maximum 1.5V/250 Ohm.

You can control the KEY-IN signal in two different ways.

The preferred mode is to connect the KEY-IN socket with a shielded cable to the transceiver's output which goes to ground on transmit. Practically all transceivers have such an output and their electrical specifications exceed the needs. Transceiver producers give different names to this output and they are for instance TX-GND, SEND, *T/R-LINE etc. Some transceivers require that "ground on transmit" is implemented via a software command, or by changing of a switch on the rear panel, or interior of the transceiver. Check in your transceiver's manual.

If your transceiver has not a suitable connector providing the "ground on transmit" output signal, you can use this second way. Connect with a shielded cable the PTT or CW keyer contact to the amplifier rear panel KEY-IN socket. Then connect with a shielded cable the amplifier rear panel KEY-OUT socket to the PTT or CW-KEY transceiver input. In this mode the amplifier will just pass directly the PTT or keyer signal to the transceiver when not powered and in STBY. In OPERATE mode it will follow it always when the antenna relay is in safe position and will disable transmitting during relay's motion or any risk situation.

Have in mind that the second way of transmit/receive control could be very useful also if the transceiver has improper sequency of its T/R signals (for instance if the "ground on transmit" signal is late, after the RF power is appeared).

2. Both amplifiers ACOM1000 and ACOM2000A are QSK-compatible with all QSK-capable transceivers on the market. The only limitations are the electrical specifications of the KEY-IN and KEY-OUT signals.

The KEY-OUT socket on the rear panel is phono type (RCA). This is an extra output signal from the amplifier to the transceiver. It could be used to improve the T/R switching process and increases the exploitation reliability

of the amplifier. This output is usable when the preferred connection of the KEY-IN socket is made (see para.1) and the transceiver has the respective input to disable transmitting when needed. If your transceiver has not such an input or you use the second way of the KEY-IN connection, don't worry - the amplifier will function normally as well and then the KEY-OUT may remain unused.

Anyway, if your transceiver has a suitable input which disables transmission, we recommend that you connect it with a shielded cable to the KEY-OUT socket of the amplifier. Transceiver producers give different names to this input and they are for instance TX-INHIBIT, MUTE, LINEAR etc. Some transceivers may require that "transmit disable" function is implemented via a software command, or by changing of a switch, etc. Check in your transceiver's manual.

The output KEY-OUT of the amplifier is open drain circuit and it can hold to ground a positive DC signal. At the moments when the amplifier is ready to transmit, this line is held to ground. When transmitting is not permissible, the output is open (for instance when the antenna relay is in process of switching). The electrical specifications of the amplifier's output are: switching voltage (open circuit) up to +50V; switching current (closed circuit) up to 20mA; resistance @ 20mA current (closed circuit) maximum 120 Ohm.

When the amplifier is not powered and also in STANDBY mode, this output is directly connected to the KEY-IN socket. Then the amplifier will return the "ground on transmit" back to the transceiver's transmit enable input.

In OPERATE mode the KEY-OUT signal will follow the incoming on the KEY-IN socket "ground on transmit" always when the antenna relay is in safe position and will reject transmitting if any risk condition is detected. Anyway, the amplifier contains an internal self-protection which keeps track on the safe QSK T/R swhitching even when the KEY-OUT is not used.

Congratulations you won't be dissapointed with the amp. what rig will you be using?
tips: read the manual twice, don't be afraid of the box! when installing the transformer ensure the voltage taps [bars] are set correctly, push in all fuses, connectors touch them don't just look at them. admire the quality of the construction.
You might notice an odor when you first turn on the amp let it "cook" a while before transmitting...oh 20 minutes or so so all components settle in. and the odor...call it that new car [amp] smell it will go away after some run time hours.
before turning on the amp run through the menu stuff to become familiar with it
them take a deep breath and press the red button! after the 2 minute period be prepared to be wowed! and enjoy the amp

regards, Marty ka7gkn@...

Hello friends,

I´ve just got myself a Acom 2000A. I´ve been using them a lot, at PY5EG contest station (ZW5B), and at the first time I used one I promised myself one day I´d have one. Well, the day has come!

I still haven´t fired it, since I still need 220V in the shack, but the plans are to be on the air on the coming weekend!

Yes!

Enjoy your Acom 1000! I just used one at V26B on 15m in the CQWW SSB and made 3900 qsos with it.

Very smooth tuning and operation. It also has many of the protections like it's big brother, the 2000, so you cannot damage it. Metering is complete too.

This is also a great amplifier for DXpeditioning as the you don't have to remove the transformer or tubes, just take it out of the box and plug it in. For a lot of travel, investment in a heavy duty shipping case with ATA rating might be a good idea so it can be checked safely as baggage.

Construction is the same quality as the 2000.

73,
Bob N5NJ

From: Herrmann, Thomas
Topic: 616 Message: 616

Can anyone explain how ACOM2000A-soft identifies the "ARC fault" ?
After more than 1000h runtime, my ACOM2000A switches off due to ARC fault;
on the other Hand, there is no indication that antenna ore feeder is broken.
I can match the antenna flawless using the FT-890's automatic antenna tuner.
VSWR, RX- & TX-behaviour without amplifier are ok. Where I have to look ?
Thanks and 73 de Thomas, DL1AMQ

I had the same thing - My vswr meter did not show a problem. My AL-1500 did not fault out. My wire antenna was bushing up against a tree limb. Cut away the limbs and no more arc fault. Krassy recommended to stay away from slopers that use the tower. There are many places to arc - I had a problem where my force 12 beams were arcing between the element and boom insulators.

73 de Bill, K5YG - Very, very happy Acom 2000A owner

I too have had 20+ arc faults this weekend during SS.

They were limited to 20-15-10 and not 80/40.

It is possible something is wrong with the feedline/antenna etc.
However
key down at full power indicated no SWR problems or heating effects.

I have noticed sometime that the RX doesn't come back to full
strength.
It is solved by a dit. This usually indicates bad relay contacts
somewhere. I can't say if it is in the amp, xcvr or antenna relay
box.

Could it be that these are symptoms of the vacuum relay failing?

Amp has 1047 hours on it and has been run mostly QSK and for contests.

Brian,
ARC Falut is a great predictor of impending failure of antennas. It's
picks up the problem well before they go from intermittent to full-
time.
In my case, one of my TH7s had some Arc faults. I ignored it for a
year. Then, after a rain, the SWR was very high. Turned out to be
spider debris including leaf material they dragged up for their nests,
inside the traps. Took down the driven elements, broke them down
to sections, took apart the traps, cleaned them out. Reassembled
antenna - worked like a charm with no more rain problems and no
more Arc faults.
Moral of the story, if you're getting arc faults, something is
intermittent or shorting somewhere.

I get ARC FAULTS when using my 160m shunt fed tower. Everything in the system seems OK...I think it's arcing from section to section. This problem only happens at high power.

Any ideas, outside of jumpering across each section?

The Acom amp has turned out to be a very effective antenna test instrument at my station. When I first installed the amp a couple of years ago, I had to change a few cables due to ARC faults.

Running the amp has forced me to ensure my antenna systems are up to par.

Thanks Barry,

I have a history of blowing out the balun in 4 band quad. Other amps completely fried it. This one seems to have had a comparatively long life.
Other possibility: There have been numerous hornets/wasps circling around the top of the tower and antenna. Perhaps they have built a mud bridge across the balun.

Who knows. I have a spare bauln. Try that first, if the hornets don't get me.

It is neat having an amp which is so "protective".

I had the same problem with the Rx not coming back to full strength until I sent a dot. Turned out to be a Daiwa A/B Coaxial Switch. The contacts were dirty --- I doubt you would have that problem with the Acom Antenna Switch as it has double contacts.

Again, Krasy said to stay away from slopers or any other antennas that radiates a tower with rotors and beams on it. I have 4/4/4/4 on my tower -- It was arcing all over the place.

I was also getting arc faults when my wire antenna came in contact with tree limbs.

My AL1500 could care less, but the 2000A faulted out all the time.

My 160m Inv-V did this during the recent PA QSO Party. The amp didn't complain, but I did ignite the tree!!

> My AL1500 could care less, but the 2000A faulted out all the time.

As it should. This is one of the reasons we paid extra for the automagic control.

BTW, I had severe ARC FAULT errors when I first got my 2000A. Some of it was attributed to cheesy connections in my RF lines. Others have attested to this method of "shaking out" one's feedlines and antennas with the ultimate "smoke test" of 1500W applied to the whole mess. I found things that were never problems at 100-200W and my station is much improved now as a result.

What I found to be the biggest culprit in my situation, however, was my Icom IC-775DSP exciter. Taking the amplifier key signal off the RELAY output of the transceiver was a disaster. K3WW and N2TK advised me to take the SEND signal off the ACC jacks in the back ot the XCVR instead. It turns out, the RELAY signal is just a hair slower than the RF out and the amp gets RF before it gets the key signal. Bad news! The SEND signal off the ACC jacks is earlier in the circuitry and just that much faster. The KEY signal gets to the amp just before the RF and it is a much happier camper.

I guess the ARC FAULT resulted from the closure of the amp's relays while the RF was flowing. Maybe Krassy or someone with a better understanding of the 2000A's internal workings can shed some light on this.

Anyhow, the 2000A has been working like a champ for me since I was enlightened to this issue.

LOUD IS GOOD!!

This is true for many newer radios. We saw this on the Icom 756Pro and also on a Yaesu FT1000MP at V26B last weekend.

>I guess the ARC FAULT resulted from the closure of the amp's relays while

My understanding is that the ARC FAULT that the 2000 reports is located outside of the amplifier somewhere in the antenna system.

If it was a timing problem, you'd see a message that says something like "Protection - RF at wrong time".

Marcelo,
Had the same problem some time ago. Turned out to be failed Molex connectors in the heater leads. There are 3 pair of them in the heater circuit . My unit was early production, serial no. 990147, and although out of warranty, the factory sent me new ones no charge.
Best wishes,
Jim, KL7JM

You have to "cook" the amp to get rid of the new
material smell? Does this mean they're not burned in
by the factory?

When I was in the amplifier (commercial) business, we
ran them hard up against the limits for 96 hours
before we boxed them. By the end of that time, we
shook out all the potential infancy failures in
components, and also did major outgassing of parts.
And we wondered if we were a bit lax. Apparently,
Acom is even more lax?

That's a disappointment...

I don't think so. When I ordered mine, Krassy received the shipment from LZ-land where it had gone thru the burn-in and QA time. Then he made the 10/12 mods (with my license) and burned it in another 24 hours before shipping it to me. When I installed it, he insisted that he be on the phone with me and had me transmit full-out into all of my antennas with him on the line. Not a hiccup then or since, and no funny smells.

I worked SOAB in CQWW and got several unsolicited comments, including calls from Tokyo and Hamburg saying I was 10-20 over! The Tokyo call was really neat because the band sounded dead but I think I had the grey-line so I started calling CQ and the JA's came out of the woodwork on 15! Fun fun fun.

An _awesome_ amp!

My 2000A is almost a year old, and I still get the "new material smell" when I run it. Not when it is idling, but when it is putting out rf. The smell is worse on high duty cycle modes, such as RTTY. Ten meter RTTY running 1500W out is the worst. It smells like phenolic burning.

I replaced the Molex connectors, and that did not help. I looked throughout the amplifier, and cant find any discoloration anywhere.

633. ACOM 1000 on air

Yahoo group: acom-list (1999 — 2009)
Date: 2001-11-11 22:53:50 UTC
From: Ing. Antonio Scolamiero
Topic: 633 Message: 633

Finally Today I put on air my ACOM 1000, I only can said wonderful, work silent, easy to tune and load, I still reading to learn some tips, with only 55-60 watts put 1 kw out in 40 meters, 20 meters and 50 mhz, now wait for and opening to put on air my 7 element yagui @15 meters plus 1kw.

Thanks for all help.

see on air.

634. Drive Power Varies from Band to Band

Yahoo group: acom-list (1999 — 2009)
Date: 2001-11-12 19:48:06 UTC
From: Richard Thorne
Topic: 634 Message: 634

Hello Group:

I was curious if other 2000a users have noticed the following:

On 15 meters, my 2000a requires about 80 watts drive to get full output (1500 watts). On the other bands the amp only requires 50 watts for full output.

However, when I took the amp down to K5NA's for CQWW SSB a few weeks ago, the amp only required 50 watts drive on 15 meters.

The swr was less than 1.5:1 on K5NA's 15m antenna and the swr on my 15m antenna is less than 1.5:1.

The only difference that I know for sure is the main's voltage. At K5NA's we had a good constant 237v and I had the tap set for 240v. At my station I have the tap set at 240v but my mains are running 225v consistently. I tried the 220v tap at my station but the transformer hummed quite loudly when I transmitted. When I switched to the 240 tap the humming went away and the amp appeared to perform better.

Another kink is that the voltage to my station (located at my office by the way) is 208v. I had an electrician install a step up transfomer which was supposed to provide 240v, but the best I'm getting is the 225 as mentioned above. The voltage to the building stinks in the first place as it varies from 200v to 208v which probably explains why I'm only getting 225v from the step up transformer.

Anyways with all this great information, any theories why I need so much drive power on 15m?

Thanks in advance.

Question: Have you tried tuning the segment where you are requiring
80 watts.
If the amp is far from optimum tune, it takes a heck of a lot of drive
to get full output. I have multiple antennas here on several bands.
The amp is tuned for the primary ant. When switching to alternate
antenna, I see as much as 500 watts of output lost. The alternate
antenna's don't have an swr much different from the primary. Thus I
would require quite a bit more drive to get it to max output with
alternate antenna-- if I didn't retune the amp.

Rich,

Why not run the amp at 208V ?

It sounds as though your building has 120/208v 3 phase power.

You could set the amp at 200v or 220v.

73,
Bob N5NJ

I'm not worthy of this list. I had totally forgotten about the auto tune feature. I have changed my antenna setup this summer which changed the tuning.

Thank you gentlemen, I am now getting 1500 watts out on 15m with 50 watts of drive. I'll auto tune the rest of the system as the new wires go up for 40 and 80 this week.

I'm trying to finish things up in preperation for SS SSB this weekend.

Hi Bob:

I did have the tap set for 200v prior to getting the step up transformer installed. I used the amp at K5NA's last July for IARU and found that performance was better with a higher main input.

Hi Guys:

Would it be a problem to run the amp with reduced drive so the output
power is around 200 to 300 watts out?

643. Re: Running 2000a at reduced power

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-02 20:52:15 UTC
From: oe9eri@yahoo.de
Topic: 642 Message: 643

I use to run only 400 Watts, the autotune funktion of the Acom 2000A does only optimize for 1,5 KW Output, reducing to 400 Watts with the exiter causes higher dissipation and bad amplifier-gain, I should normaly tune manual to the drive of 400 Watts to achieve the optimum gain at lowest dissipation - this is a pain for each band, I could tune into the memories for 400 Watts drive, have to look always onto the remote-controler-display to be shure to have the right setup.

That describes the low-power-problem - which is the only dissapointment that I have found with this excellent amplifier in more than one year of usage.

To run SSTV or RTTY at 400 Watts (with autotune) makes the amp running hot nearly than running at 1500 Watts.

Best Regards,
Helmut oe9eri

When I get up in the morning, I turn on the coffee and the amp. The 2000A stays on all day until I leave the office/shack in the evening. Don't want to miss working one I need while waiting for the amp. Figure with the life of the tubes it will be a long time till I have to replace them for letting the filaments cook. Probably should pick up a spare pair of the tubes as they are cheap compared to the 3cx type tubes.

By the way, my 2000A is in the basement where my coax comes in to the house. Just have the RCU by the rig.

I also really like the amp.
Tony

Your use of Yahoo! Groups is subject to http://docs.yahoo.com/info/terms/

647. Re: [acom-list] any tips for tube longevity?

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-03 12:06:36 UTC
From: K4HW
Topic: 641 Message: 647

You mean you have yours!? How long did it take you to get it?

I have been waiting 8 months and do not have it yet! Even paid for it already.

Thanks

Hal

writes:

<< My question should I just keep it in STBY for the hour? or is what I'm
doing still ok. >>

The answer is Yes -- You will get longer tube life by leaving the filaments
on all the time. There is much stress on the tube filament heating and
cooling. Same with a light bulb -- leave it on all the time and it will last
longer.

Reducing the filament voltage during long standby periods is common practice
in the commercial world. This would not be practical to due with Amateur
Radio gear.

From: k5yg@aol.com
Topic: 642 Message: 649

In a message dated 12/2/01 12:28:42 PM Central Standard Time,
rthorne@... writes:

<< Hi Guys:

Would it be a problem to run the amp with reduced drive so the output
power is around 200 to 300 watts out? >>

No problem - Krassy does it all the time! Your signal will probably be
cleaner with the 2000A in line. Krassy performed spectral measurements on a
FT-1000MP with and without the 2000A in line. The 2000A 2nd and 3rd
harmonics are lower than the FT barefoot. The 2000A makes a good antenna
tuner!

Procedure:
Tune the 2000A at 1.5 KW output --- THEN reduce the drive to operate at the
lower output level. This is a linear amplifier - so all is well --

Efficiency will suffer -- but who cares about burning a little more juice? Do
not expect the tube temperature to be significantly reduced.

From: N2TK
Topic: 641 Message: 650

Bought it a year ago. Only took a few weeks then. But I understand that Acom has quite a backlog now.
Still waiting for their alpha-numeric display for their coax switch - then I will buy one.
Tony

Topic: 641 Message: 654

Hi Krassy,

My cable is still working ok so if the buffered cable is still coming I can wait. Really it is no problem. It just kinda came up in our discussion. By the way, I have the 3KW remote control automatic tuner working now. Makes a wonderful combination with the amp.

73, Hal -K4HW

655. Re:HOW TO USE ITS RF POWER BETTER

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-04 14:47:31 UTC
From: aa1nd@aol.com
Topic: 655 Message: 655

Hi to all,
The ACOM2000A - HOW TO USE ITS RF POWER BETTER
or another look at DEF- and USR-tunings

I. Facts
****

Default (DEF) tunings are factory-set capacitor positions of the output tank, available for use when the amplifier's load is very good. Real loads however, especially HF low-band antennas, often present a VSWR greater than 1.5:1, which usually necessitates the use of an outboard antenna tuner.

ACOM2000A will perform the functions of an automatic antenna tuner if you would prepare user's tunings (USR) for your antennas.

The AUTO-TUNE sub-menu launches an automatic procedure of matching the actual antenna impedance to the optimum tube load. You are strongly advised to run AUTO-TUNE periodically. It will ensure maximum plate efficiency and RF gain at nominal output power, with minimum IMD.

When you start the AUTO-TUNE procedure, the amplifier begins continuously reading its RF impedance sensors that monitor the plate impedance. It meanwhile controls both TUNE- and LOAD- capacitors of the plate tank in accordance with RF sensor indications, thus running in a closed loop system. It looks for a minimum deviation from a pre-set plate impedance of about 1250 Ohms (pure resistive), deemed to be the optimum load for the tubes. The deviation from a optimum value of the active impedance part controls the LOAD, while the TUNE responds to the reactance deviation from zero. There is only one TUNE/LOAD combination valid for particular antenna impedances.

After finding the capacitor positions, the result (i.e. the updated motor settings) is automatically stored in the amplifier's nonvolatile memory as an USR-tuning. With an actual USR-tuning in effect, the tubes will see "their" optimum plate-load impedance of 1250 Ohm (pure resistive), regardless of a non-perfect antenna impedance currently used. As it can be expected, particular impedances would need different USR-tunings.

These USR-settings will be automatically retrieved (instead of a DEF-setting) whenever you would select the same frequency segment later, with the same antenna number. Thus, the tubes will feel a good load at all segments and antennas. The only proviso is that the antenna has not changed its impedance too much, after your last USR-tuning update.

If you however place another antenna, or old antenna impedance has greatly changed, you have to update the USR-tuning accordingly. With an outdated USR-tuning you would most likely get bad results, despite the new antenna might present same or even better VSWR. The reason would be that eventually

the outdated USR-tuning has been done for another antenna impedance. Please note that a VSWR value is not sufficient for positive impedance comparison: both the active and the reactive impedance components must be equal.

Practically, you may need to refresh your USR-tunings after you install a new antenna, or if you change any cable installation, or whenever any significant antenna environment change occurs. It is a good idea to refresh tunings at least once monthly (or more often, depending on your particular conditions).

N O T E
=======
The REFLECTED POWER and the measured VSWR depend on the load impedance ONLY and not on the amplifier's tuning quality. If the impedance is different from the nominal (50 Ohm pure resistive), the REFLECTED POWER bargraph will always indicate a reflected power presence, even at an excellent USR-tuning.

An actual USR-tuning (compared to a DEF) will however allow using the amplifier at a greater power, with no signal distortion, as well as with no danger to the amplifier.

II. Exploitation directions
****

1. Always prefer USR- to DEF-tunings. Even when the antenna impedance seems perfect, an USR-tuning would improve the amplifier's performance.
2. Refresh your USR-tunings periodically.
3. Take advantage of 10 tuning memory cells available per each segment.

The amplifier is capable to store data for 10 different USR-tunings for each frequency segment within a band. These USR-tuning cells are identified by different numbers (A1 to A9, and AM). You may use different tunings in same frequency segment, irrespective of a really different antenna, or different conditions for a single antenna (for example for damp and dry weather), or with different tuning options selection (see S.III-1 below).

If you have the ACOM2000S / ACOM2000SW automatic antenna switch available, you would not need any manual operation while changing bands, band segments, or different antennas within a band. After an initial setup, the antenna/frequency change operation is fully automatic. You may only need updating the USR-tunings periodically.

With some other antenna switch system, you will only have to select the respective USR-tuning number (A1 to A9, and AM) by the RCU buttons. Anyway, you must have them saved properly during the AUTO-TUNE procedure.

4. USR-tuning: preparation and update.

N O T E If you use more than one antenna per segment, it is necessary that you select the proper antenna number PRIOR to the next step. You may "overwrite" some useful tuning for another antenna number otherwise. We recommend that you prepare USR-tunings near the center frequency of the segments, but you could do them for any preferred frequency.

- Plan the frequency segment-to-antenna number correspondence;
- Select the proper antenna number and frequency;
- Press ENT twice. You'll get the following screen:

```
--------------------
|APPLY --- 10 TO 20W |
|DRIVE =___<_____>___|
--------------------
```

- Apply 10-20W CW drive with the necessary frequency;
- The procedure will be automatically executed in less than 3 seconds;
- Remove the drive power after the tuning is completed.

III. Tuning Options
****

1. Understanding the LOW-NORMAL-HIGH mains voltage option.

It is not mandatory to use this option, although you could optimize the amplifier's tuning at some conditions. It is done via small changes (about +/-10%) of the plate-load resistance, as an object of the AUTO-TUNE.

This option is a part of the DEF sub-menu (part of the OFF menu). To access it, press ENT button while in OFF menu and then select DEF using the right-arrow button and press ENT again (see also page 22, 5-6a of the Operating Manual). The result of a new selection however takes effect only after an USR-tuning refresh.

N O T E: The option LOW-NORMAL-HIGH does not affect any power supply voltage inside the amplifier. It merely lets you optimize the amplifier's tuning to your real conditions. You cannot substitute a voltage selector change on the MAINS PCB that is mandatory at any line voltage deviation above 10%!

C A U T I O N: Inappropriate use of the LOW-NORMAL-HIGH option could drastically shorten the tube life or reduce the power gain or the maximum undistorted output power. Do not select "LOW" unless your mains voltage is really low since tube cathodes will be exhausted FASTER than with NORMAL or HIGH selection, while 10% more/less power does not make a difference on the air.

Selecting HIGH you will request for a higher plate resistance, thus optimizing the tuning for a higher mains voltage. You would get better plate efficiency, higher power gain, and longer tubes expected life, at the expense of less maximum output. It is normal to use the HIGH option when line voltage is typically 5-6% higher than the nominal voltage tap selected (i.e. higher than 252V at 240V nominal). In addition, you could use HIGH selection to optimize the tuning for lowered-power operation (for instance, at heavy-duty modes (RTTY, SSTV etc).

If you select LOW, you would request for a lower plate resistance, thus optimizing the tuning for a lowered mains voltage. Select LOW when mains voltage is typically 5-6% lower than nominal tap (i.e. lower than 228V with 240V nominal). A LOW selection would increase the maximum undistorted power, at the expense of more intensive cathode use of the tubes and more plate

heat, so tubes life would be correspondingly shortened. Also, the amplifier's power gain is decreased, i.e. you'd have to use the transceiver at much higher output.

C A U T I O N: for a predominating voltage deviation greater than 5-8% you'd better change the nominal voltage selection on the MAINS PCB to the nearest nominal voltage tap (either 240, 220, 200, 120 or 100V).

We generally recommend for the LOW-NORMAL-HIGH option to correspond to your real mains voltage status. Particularly, you could select the "HIGH" position regardless of the real line status, in order to extend tubes life if you don't need the full output power.

Using the LOW-NORMAL-HIGH option flexibly, you could for instance prepare several USR-tunings at HIGH selection and save them as different antenna numbers for same antenna. Then restore the NORMAL selection and prepare normal USR-tunings. This way you will be able to quickly optimize the amplifier's performance for brief line-voltage deviations, or lowered power operation, by a fictitious change of the antenna number for same antenna.

2. The AUTO ANTENNA CHANGE option.

The amplifier can control the antenna change automatically while it changes bands and/or frequency segments, depending on your selection. The amplifiers leave the factory with ON selected.

While in OFF-menu, select DEF sub-menu, then press ENT twice to reach the "AUTO ANTENNA CHANGE" sub-menu. The selection is changed by means of the LEFT and RIGHT buttons:

```
--------------------
|AUTO ANTENNA CHANGE:|
| [ON] OFF |
--------------------
```

Selecting of ON or OFF does not change any tunings stored for different antennas in the nonvolatile memory. It only concerns enabling and disabling the automatic antenna selection while following the transceiver's frequency.

a) With "ON" enabled, you can change antennas also manually via both RCU and/or antenna selector buttons. All antenna numbers are set to #1 for all segments after a memory erase, until you change them manually. The last used antenna number for a particular frequency segment would be automatically retreived when you return to this segment later (of course, together with its individual USR-tuning if you have it prepared).

b) If you select "OFF" in the "AUTO ANTENNA CHANGE" sub-menu, antennas would be changed only when you select a new antenna manually from the RCU or antenna selector buttons, but never while automatically changing frequencies and bands.

When you select a new antenna number from the RCU, it is assumed "the last used antenna" for ALL frequency segments. Thus, changing frequencies would

never change your antenna or tuning number, unless you give an explicit antenna change command.

Changing antennas by either antenna selector or other type distance commands through the serial RS232 port has a "local" effect, i.e. it modifies the currently used segment only. Such local modification is hold until you give a manual command from the RCU. This means, the RCU has a priority to equalize antenna numbers for all frequency segments when auto antenna change is disabled.

Topic: 656 Message: 656

Hi all Acom users,

If anybody wont to improve the function "DETECTED RF POWER AT WRONG TIME" protection trip in a Multi-Multi operation, we would suggest the following. The multi-multi operation frequently is dangerous for both the transceivers and the amplifiers if not properly decoupled and filtered. You can easily check what portion of the transmitted power is induced in a particular antenna. Place a wattmeter and a dummy load on the cable end, and transmit with other antennas while rotating them in possible combinations.

This power is passed through the amplifier's output antenna relay, through its INPUT relay (which is much weaker), and is fed to the amplifier's input. The power is then reflected there by any filtering unit (that is usually placed to guard the transceiver), and it then returns through the same path, to the antenna.

If you press the PTT during a neighbour's transmission, and if there were no such a protection, the relay would be "hot" switched. The relay's contacts might withstand several times 50-100W without melting, but their golden plating WILL be 100% vaporized and burnt by multiple "hot" switchings. Then cross-modulation (and RX interruption in more severe conditions) will occur since the uV/mV-levelled recived signals come from the antenna through the same path. This is the reason to set a protection against TX/RX changes while the induced in the antenna RF power exceeds a preset "too high" level.

The level at which the protection trips is originally set at about 2W. It can easily be increased. It's only needed to replace on the INTERFACE PCB the resistor R86 from 390kOhm to 150kOhm. You could place a 220kOhm resistor in parallel to the original one (390kOhm), which will take the same effect. This way, you will increase the protection level 6 times (from 2W to 12W). It seems like it would be still safe for the input relay, thus resolving most practical problems with adequate decoupling and filtering between antennas, when only "several dB" is needed.

C A U T I O N !

Please be aware that you should not go to extremes with the protection desensitization since it would result in a relay damage!
Please don't do any changes if you have no plans to use you ACOM 2000A in M/M environment.

Delighted to see long awaited control software for Acom 2000.
However, I for one am not home free. Acom manual warns against use
of standard serial cable. Refers to tech manual for special cable.
Basic information of this nature should be readily available but I
can't find it. Is it a null modem cable? Standard cable has same
effect as NC. Any clues?

When I was beta-testing W1VE's version of the software 1-2 years ago,
I was told to build a 3 conductor cable (RXD, TXD and gnd). I bought
the connectors at Radio Shack, built the cable, and it works.

From Krassy:

Hi Hal,
I see the discussion regarding the Extension cable for RCU for ACOM2000A. I never say that simple extension cable will not work. It may work. We instal inside of the connectors amplifiers in order to make the signal strength better and to make sure that the extended cable will work for sure.

665. AcomTools and Writelog

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-08 16:27:09 UTC
From: Barry
Topic: 665 Message: 665

Hi all,
I am trying to get AcomTools software to auto-switch the Acom amp's frequency as selected by Writelog, prior to invoking auto-tune by transmitting. I emailed the author of AcomTools, and he told me to load WL first, then AcomTools and it should work. However, it doesn't. I tried unloading and reloading the frequency switching extension, and also checked to see that Writelog was selected as the controlled program in the extension. I wonder if anyone else has tried this, and if anyone has gotten it to work?
Thanks,
Barry--

Hi Barry,
I am also trying this but am getting the message:
"WriteLog not started or not available. Try starting WriteLog before
Hamtools."
WriteLog is running before I start AcomTools.

I have just tried TRXManager. With this program there is no error message
and
AcomTools shows Mode:TRXManager under Frequency switching. So far so good
but nothing happens when TRXManager changes band.

668. Re:for k3ko

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-09 23:30:21 UTC
From: aa1nd@aol.com
Topic: 668 Message: 668

Hi Brian ,
The amplfiier uses an internal frequencymeter to detect new frequencies while you are transmitting. The signal to the frequencymeter is taken from input drive (about 1/100 of input voltage). It is then amplified, limited, and fed to the digital input of the counter. The uP reads frequencies only when enough drive amplitude has been detected for at least one millisecond . The frequency resolution is 2kHz and the readout is refreshed on each millisecond (provided enough drive). A new frequency is recognized to be valid after five equal readings.

After a new frequency has been detected, the uP first estimates wheter the band-switch has to be turned, or only a new frequency segment is to be adjusted. If the new frequency belongs to the same band-switch position, the uP doesn't break your transmission. It only tunes the air variable capacitors to correspond to their memorized position for the new frequency segment.

If the new frequency belongs to a new band-switch position, the uP first lowers the screen-grid voltage (from 340V to 15V DC) and increases the bias voltage to the control grid (from -55 to -120V DC). Then it waits for 0.2 seconds for the new voltage levels to settle, and after making sure that the anode alternate RF voltage is zero, begins turning the band-switch to the desired direction. After having found the needed position, the uP returns the normal operating voltages back to the tube (340V DC to the screen grid, and -55 or -120V DC bias to the control grid - with respect to your current PTT or KEY status). The antenna relay, as well as the input relay, do not change during these operations, so any drive input power keeps on being dissipated into the 50-Ohm input swamping resistor in the same way as it does during normal operation.

The process described above doesn't care what is the frequency skip. The effect that you have noticed, is imaginary. The problem is that the uP doesn't refresh the LED-bar display while processing the new frequency and while turning the band switch. This way, if any power has been indicated at the moment of applying a new frequency, the LED-bar is "reezed" for a while, during band-change operations, thus showing an imaginary power output. There is no real RF power flowing however.
When changing from 40 to 20m, the amplifier manages to act as a frequency doubler for the single dit you transmit on 40m since the output is tuned on 20m while you transmit the first dit. The resultant output at this moment (mainly on 20m) is then being indicated during band-switch rotation. After finished movement, the uP refreshes the LED-bar indicator with currently available output power and the LED-bar goes soon to zero.

For any other band change the amp shows zero output since it cannot act as a frequency doubler (for instance from 80 to 15m) and the new-band transmission causes no output on the old one. You could however find out a similar effect

when changing from 20 to 10m or from 80 to 40m.

Moreover, you may use not only a dit for changing a band, but just press the key down on the new frequency as long as you wish. The tubes will be disabled as soon as the new frequency is detected (in 10ms), so your transmission on 20m will be cut down to about 10ms, and will be directly continued on 40m, after the band-switch is re-positioned (in about 0.5-1 seconds).

You have maybe used a peak-reading wattmeter that normally prolongs the indication for a single dit to about one second or so. You could check its response with a single dit without changing the band. It's better to use for this purpose a station-monitor oscilloscope or any other type of very fast output indicator, to be fully convinced that no hot operation occurs.

Best 73! Stan, LZ1IU

Thanks for the reply Michael. I took the liberty of posting your response to the Acom list, for others who may be interested. The list, acom-list@yahoogroups.com, is relatively low volume, and discusses all aspects of the Acom amp. You may join by going to www.yahoogroups.com and selecting the list, or just send an empty e-mail to acom-list-subscribe@yahoogroups.com.

Thanks for your help. I will install the updated version this evening, and let you know how it goes. I have been testing the software with Writelog, in a file that has already been created and has 2000+ entries.
Barry

670. ACOMTools update

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-10 14:55:29 UTC
From: Michael Elfial
Topic: 670 Message: 670

Hi to all,

Why it not worked with WriteLog and the soulution.
Soulution is download the new archive - you can download the smaller one (novb) if you have one and install over it. Then use the "WriteLog 10 notifier" instead of the other notifier listed in the "Frequency switching" configuration.

What is the problem:

If there are some Win32 API programmers among the list members - read this - you may have the same trouble some day. EnumChildWindows and some other functions with similar functionality are described in MSDN as follows: Their parent window parameter can be NULL and this will enumerate the desktop windows... Unbfortunatelly this is not the truth - on Win98 SE and probably on some other versions of Windows (excluding Windows 2000/NT4 and Win98 first edition) function fails if the parameter is NULL. GetDesktopWindow API function must be used to obtain its handle (usualy 0x80) in order to make them work as expected. What this means for ACOMTools - every extension that depends on window find operation will fail on these platforms. And this is true about the Gerry's program too - the notifier DLLs are were the same until today.

I don't have the libraries used by Gerry in its notifier componentes thus I added a new component to the ACOMTools - an ActiveX for Window manipulation. Also I wrote new notifier for WriteLog - "WriteLog 10 notifier". The archive is updated now but as you can see I'll need to rewrite the other notifiers (for another programs) too. Thus there will be one more update - I hope I'll have enough time to do it this week - I'll post a message here. Additionally I'll optimize the window management control a little.

If you are interested in programming notifiers - now you can do it in scripting - VBScript/JScript - see the new pages on the site for more start-up information.

Michael,

I have been using an older beta version of your application which I tested for Krassy a few months ago. It has been functioning properly with WriteLog. But, there is a problem that I think you should know about. I just found it a couple of weeks ago.

I am running the application with WriteLog under Windows 98. I recently set up my system to drive two displays in Extended Desktop mode. In this mode, the window sizing of AcomTools does not remain fixed. When there is other window sizing activity elsewhere on the desktop, AcomTools "forgets" what size it should be. Sometimes it becomes a very small square on the screen. When this happens, it is impossible to bring the app back to proper size because the menus are inaccessible. So, the app has to be killed and restarted. This happens all the time, but the basic operation of the application is not affected.

I'd appreciate it if you would please look into this.

Thanks,

Jim K1IR

673. frequency switching now OK

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-10 18:40:55 UTC
From: Dick Green
Topic: 673 Message: 673

Michael,

I've tested your latest version of AcomTools with the new Writelog 10 notifier and it works perfectly under Windows 2000 with Writelog 10.28D. I am very pleased about this because it solves an annoying problem when using the 2000A with Writelog's advanced two radio switching. Without AcomTools, the 2000A would lose the first part of a function key message when a band change was required. With AcomTools, the amp changes bands as soon as the band is changed on the rig - no more problem! I was also very pleased to see that the frequency change follows Writelog's keyboard focus, which is the correct way to do it.

Thank you very much for the work you have done to get this software working and make it available to Acom owners. Also, thanks for the response to my problem report.

I have a suggestion for another extension (or perhaps an enhancement to the Auto Tune extension.) The DOS program ACOM.EXE provided on the Acom CD is very useful for quickly retuning all of the 2000A's segment memories. This is great if the memories have been reset or changes have been made to the antenna setup. Unfortunately, this useful program will not work from a DOS box under Windows 2000, so I have to reboot in pure DOS mode from another disk. It would be terrific if similar functionality was available through AcomTools. Of course, the rig must be controlled in order for this function to work. The DOS program is limited to the FT-1000MP, so the proper command sequence could be copied to an AcomTools extension. A better way would be to get the external program (Writelog, LogWindows or TRX-Manager) to do it. That way, many rigs could be supported without new code. Do these programs provide an interface that can be used by an extension to command frequency changes?

From: Barry
Topic: 674 Message: 674

Thanks to Michael for some quick troubleshooting and fix. AcomTools
is now working fine with Writelog. It's neat to just turn the dial on the
xcvr or click on a packet spot and have the amp follow! Wonder if
anyone has spoken with the DX4WIN guys about providing whatever
info is needed to support AcomTools?

From: Richard Thorne
Topic: 676 Message: 676

Hi Group:

I downloaded the latest file but I'm having a problem.

When I first initiate the program the configuration comes up. I enter all the appropriate data per the instructions.

When I'm done I have AcomTools showing up in my tool bar but I cannot restore it to the screen. When I click on the toolbar at the bottom of my screen it just highlights and unhighlights.

I've uninstalled and reinstalled a few times without much luck.

Any ideas?

I'm looking forward to the new software as I'm rebuilding my remote controlled station using my 1000mp and TRX manager.

Richard,
I noticed that sometimes the program goes "below" the screen with only
the title bar visible. Instead of clicking it, try dragging it up.

Thanks Barry:

I'll try that tomorrow on the machine at my office. Its working fine here on the machine at home with XP, although the amp is not connected as it is up at the office.

Yes, a HUGE thanks to Michael (a non-ham, but a top-notch programmer)
publicly and personally from me for picking up the ball on the AcomTools!
He has done a great job.

It was actually Jim, K1IR, who initially came up with the idea of
tracking the amplifier along with Rig frequency. Thanks to the VERY open
API of Writelog (thanks Wayne), it was very easy to write a
frequency-tracking plugin. I've also done one for LogWindows
and a couple of other programs... I'd be happy to provide the DX4WIN
folks with what they need.

The frequency plugin can be created with any tool which can create
COM (ActiveX) DLLs, such as Microsoft Visual Basic. (The Writelog plugin
was done in VB).

The only warning I would point out to you guys is to not leave the
tracking feature enabled at all times (as the motors will get a real
workout!). During a contest -- GO FOR IT!

73,

Gerry, W1VE/VE1RM

I wonder if I am missing a point. What is the advantage of the Acom changing frequency as the transceiver changes frequency? It would seem there would be an exaggerated amount of motor tuning activity as the Amp follows when really the only time there is a need for frequency change and tuning is before actually transmitting. Of course this happens in a blink with a dit or a partial syllable. Comments?

Not really the "blink of a dit" or partial syllable. Yes, the motors
will turn alot. Therefore, use in moderation.

Good Example:

Your running on 20 meters in a contest. Staying on same frequency.
You want to "Point and shoot" a multiplier on 15m from the packet
window.

Without this software feature, you would point and shoot. On CW, the
first dit/dah, or perhaps more, of your callsign would be missing the
firsttime you dump it. With the software, the amplifier is ready to
transmit as soon as your transceiver changes frequency.

If you're tuning the band for stations, it is still ok, because you
won't be going across band segments that often.

Of course, turn it off for general operating!

73,

Gerry, W1VE/VE1RM

That "dit" forces you to do something before you really start calling in the pileup. It's an inconvenience. The other advantage is clear when you are using the Acom antenna switch, in addition to the amplifier. In this case, the antenna changes to the correct one for the band you change to, and the amplifier tunes just as you switch the band from the front of the transceiver. It's truly automatic. Regarding wear and tear, remember that the amplifier is only changing settings when you cross tuning segments, not as you turn the knob just a few kHz. Although there is increased motor activity, this should not overtax the mechanics of the amp. We had a very early test version of this software running here, and trying it in several major contests has shown that this is not something to worry about.

Jim

From: Jim Idelson
Topic: 687 Message: 687

Actually, I do have it running all the time - not just in contests. Although WriteLog is not a very good general logging program, operating the station with all this automation is really fun. My experience - lightning is far worse for your station than running HamTools.

RE: FWD: [acom-list] Hamtools

That "dit" forces you to do something before you really start calling in the pileup. It's an inconvenience. The other advantage is clear when you are using the Acom antenna switch, in addition to the amplifier. In this case, the antenna changes to the correct one for the band you change to, and the amplifier tunes just as you switch the band from the front of the transceiver. It's truly automatic. Regarding wear and tear, remember that the amplifier is only changing settings when you cross tuning segments, not as you turn the knob just a few kHz. Although there is increased motor activity, this should not overtax the mechanics of the amp. We had a very early test version of this software running here, and trying it in several major contests has shown that this is not something to worry about.

RE: [acom-list] Hamtools

I wonder if I am missing a point. What is the advantage of the Acom changing frequency as the transceiver changes frequency? It would seem there would be an exaggerated amount of motor tuning activity as the Amp follows when really the only time there is a need for frequency change and tuning is before actually transmitting. Of course this happens in a blink with a dit or a partial syllable. Comments?

This is essentially the problem I set out to solve with my 'Basic Stamp' controller project. I sent the article off to QST yesterday - we'll see if they want to print it, if not, I'll post here.

The idea is simple - the controller tracks the rig's band selection (not freq selection) and sends antenna selection commands to the 2000S. If the radio changes to a band we've transmitted on before, it also sends a 'change antenna & band' command to the amp. This means the amp follows you as you change bands, but within a band you can tune freely without motors running. You still need the 'dit' to get tuned up to transmit but one you have, you can come back to that band and the amp will be ready. (QSY _within_ the band such that you're in a different amp segment and you have to 'dit' again, but that's pretty minor).

The other problem I wanted to solve was multiple antennas for a given band. The controller can be programmed with your antenna setup so it knows, for example, which antennas make sense for 20m and allows you to cycle thru them. It inhibits xmit on antennas that are not in-band.

Anyway, it's more of a middle-of-the-road solution - keep the amp 'close to ready to go' while minimizing motor motion while tuning around.

I differ with your conclusion about not changing band segments often.
Operate the 10M contest this weekend and see how often you will be
changing band segments.

By the way, I've used the ACOM amp in a few phone contests purely in
the search and pounce mode of packet spots (regardless of band!). The
result was probably a record for band changes in a given contest. I
hate phone and this is affords me a way to at least contribution to
the club's score. I've often wondered how much this mode of operation
can be tolerated.

Hi Howard,
You have not missed a point. You make a good point. I manually switch antennas, owing to the fact that there are 2 choices of antenna on 15, 20, and 80 meters and I often do a lot of listening on several bands before transmitting. I do not want the amp chasing my listening frequency around.
Best wishes for the holidays,
Jim, KL7JM

I really wonder if the motors (stepper motors, I think) in the amp are the factor limiting this kind of use. It seems to me that their use in the amp is pretty low duty cycle compared to normal stepper motor applications. I'm more concerned about the couplings slipping or something else mechanical failing first-- assuming that the motor power supply is adequate.

The multiple antenna/band issue has been discussed here in past posts. It is a real problem.

693. 2000SW at the tower base!

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-12 18:41:20 UTC
From: Brian, N8WRL
Topic: 693 Message: 693

After procrastinating for some time, I finally got the 2000SW moved to the base of the tower. My house is built on a crawl-space and the cable tube from the tower comes up underneath my shack, so I used to have the 2000SW under there along with the suppressors. The main reason was the length of the 2000SW/2000S cable.

But that meant all the antennas on both towers were a 'home run' back to the house. Last may I picked up a fiberglass wiring box at Dayton and mounted it on the tower and moved the switch and all the suppressors out there. I already had a 6 conductor cable in the tube that used to control an Astron switch (3 spares ones now!) which is easily handling the 2000S/2000SW signals.

Now I have four 'found' 150' lengths of RG213-class coax! Hmmm...

Not sure if anyone would be interested, but I do have pictures I could post.

I've designed my station around the Acom amp and switch. I made the decision to put the switch in the basement and run coax from every antenna back to the house. The common of the switch is a relatively short cable from the basement up to the operating room on the first floor. And the control cable to the switch is also quite short. This is a very flexible solution. It allows us to reconfigure the antennas for SO1R, SO2R and Multi-Single without leaving the basement. I like this approach very much.

Now that I've completed the trench and the conduits for the cables, I have to build up that surge suppressor panel soon...

From: Brian, N8WRL
Topic: 693 Message: 695

Hi Jim!

That was my thought too, and it worked out very well - easy and convenient to work on. But two things were nagging me:

1. With surge suppressors under the house, that's where they'd be doing thier job! That is, if I had a lightning 'event', it would be closer to the house than I'd like.
2. I've got plans for more antennas and the added expense of the 'home runs' for the coax is just too hard for me to justify.

I left one of the runs in the tube just in case I want to add another switch or something for SO2R. That will be a while off, tho - I still need lots of practice for SO1R!

697. AcomTools - Observations/testing

Yahoo group: acom-list (1999 — 2009)
Date: 2001-12-13 21:52:07 UTC
From: Richard Thorne
Topic: 697 Message: 697

Hi Group:

I installed AcomTools on another machine and it now works. For what ever reason I can't get it to work on my Win 98 machine. I'll work on that problem as I'm sure its a pc problem and not a software issue.

A couple of observations:

1: If you have autoconnect checked, bring up the software and then turn on the amp the amp turns off saying there is a micro processor conflict. If I start the amp first then the software I don't have a problem. However, if autoconnect is not checked I can bring up the software and turn on the amp without a problem. You just have to connect to the amp after the fact. In order to use the remote 'ON' function the software will have to be running first in order to turn the amp on.

2: Since I'm going to use this for remote control of the amp I played around with the stby/operate and on/off commands. The stby/operate commands work just fine. However, the amp will not turn off using the on/off icon. But, if I use the pull down file menu and select off it will turn off. Thats not a problem for me because it gets the amp off, but if it was intended for the on/off icon to accomplish this, it doesn't work.

I beleive I already know the answer to this question from other posts but would like to confirm it.

For the serial connection I assume you only need pin 2 and 3 and ground? with pins 2 and 3 crossed to make it a null modem type cable? I'm using the cable that came with the 2000sw switch and its working fine. But this would be a good thing for users of the remote controlled Kachina 505dsp. The remote boxes pass throug two serial ports but only pass pins 2 and 3. This way the software can be run on the pc at the controll end and no pc is needed at the remote end. The kachina rotor control has 5 relays to be turned on and off and I used one of them successfully to turn the amp on remotely.

Hi Alpo:

A null cable reverses the transmitt and receive signal lines. For example, on a DB9 a null cable has pin 2 on one end of the cable go to pin 3 on the other end and visa-versa.

Somewhere there is a web page that has the drawings and tables, but I don't have it bookmarked. Someone here on the list probably has it.

Search on Google for 'null modem cable'. You will find many pages with schematics.

One is: http://www.loop-back.com/null-mod.html

Hello all raeders!

Merry Xmas and HnY!!

Well , askin explanation of wrd nullcabel!
My dictionarys dont knw wrd or they give wrd what dont match!!
Could I have some drawing or simple explanation to understand what it
is.
Workin with Acom 2ka and FT1kMP. Well ,after 41 years of Ham, this

As I recall (going back about 2 years, when I wired up this cable for a
beta test version), you only need 3 wires:
GND-pin 5 both ends
TXD-pin2 on one end connected to pin 3 on other end
RXD-pin3 on one end connected to pin 2 on other end
These pinoutsfor DB9 connectors. If you are using a DB25 on your
computer, GND is pin 7, other two are the same as DB-9.

I also recall there was some problem using a complete pre-made cable
with the other wires connected, if not using the Acom antenna switch.
Maybe that is different with the current software. K1IR or N5ZC, do you
recall what that was all about?

Out of the Box null modem cable works FB.You can also modify standard serial cable by crossing pins 2 and 3 on a DB9 connector as previously stated by Richard Thorne.

I'm awaiting my new ordered ACOM1000 but he didn't arrive today, bummer.
I will be giving the amp a testrun on friday on a couple of monobanders at OT2A contest station.
Im' very exited about this new amp !! I guess the extra price is worth it agains Ameritron or other 1KW linears.
First you get 6 and the also the features are great.

Ps, is the power reading on the LCD screen (forward, effective, returned) qiet accurate or not, any comments ...

Phillippe,

We used one of the Acom 1000's thanks to Krassy & Acom at V26B this year on 15m and it was great! We made just under 4000 qsos in the CQWW test with it.

The metering is very accurate on the 1000 and also on the 2000.

I own a 2000 now and plan to add a 1000 to my shack soon to get 6m capability at high power.

73,

Bob N5NJ

715. 2000S 'chirp'?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-01-09 00:51:35 UTC
From: Brian, N8WRL
Topic: 715 Message: 715

Hi all!

I send serial commands to my 2000S, much like the 2000A would when it changes antennas. Recently the 2000S started 'chirping' when it changed antennas. If you manually press the up/down buttons, it always makes a chirping sound when it changes antennas. When it receives serial commands, it doesn't always - some times it does, other times it doesn't. Anyone know what the rule is?

Dear Sirs,

I have an Acom 2000 and still don't know how to set the main transformer tabs. This is the what the amp says abt the main voltage:

Saturday in stb mode transmitting 800W
227 218
225 217

Monday in stb mode transmitting 800W
223 217
227 221

Thursday in stb mode transmitting 800W
230 223

What is the best main voltage setting (transformer) for my amp to have the longest tube life? What is the best mains setting in the remote controle (high low)?

Kind regards,

Martin,

The best AC voltage is 230VAC
All my transformers are wired that way (ON)
I guess in PA the same line voltage occurs as over here.

Regards and 73,
Phil, ON4VP

Martin:

I have mine set to 240 and have a mains voltage that is similar to yours. I tried 220 but the transformer hums quite a bit at this setting.

With your low power out you probably also need to run auto-tune on each antenna/band segment. I was not getting full power out on a few bands until I ran auto-tune. I now get 1500 watts out easily with +- 50 watts input.

I got a really good (and typically fast) reply from ACOM on this:

Today we investigated the "chirp" problem that you have noted. The main conclusion was that it is not a problem indication and culd not lead up to any damage.

Nevertheless, I must say that it is a critical timing. Here are the details:

1. If you give a serial command to change an antenna, the uP changes its BCD code to the switch and waits for 160ms (timeout) to see a "READY" to be returned. The switch needs about 30-50ms to change its contacts but it returns the "READY" about 130ms after the command has been sent. In other words, there is a 250% time margin between the moment of the real contact action and the moment of confirmation (130ms compared to 50ms).

2. The time margin between the 130ms-moment of confirmation and 160ms-timeout of the uP however is only 20% and is insufficient. The 160-ms timing is quartz controlled by the uP system. The 130ms-timing however is made by a RC-controlled timer located in the switch box. It may vary more than 20% depending on the components tolerance, the ambient temperature etc, sometimes increasing above 160ms. Then you would hear a beep for a short period, equal to the amount "ms" above 160. This however has only a sound effect and is not of functional importance since the contacts have been closed at least 80ms earlier. The only effect is that you would hear this beeping signal sometimes depending on the ambient temperature (of the switch box).

3. If you manually press the up/down buttons, the uP first makes a short beep to denote that the button pressing has been registered. Then it waits for 500ms to see whether you would press or not the same or the other button several times (in order to change several numbers at once). It would beep at each next pressing made within 500ms after the last one. When 500ms have expired, the resultant number is given to the switch. The timing is then the same as it was described in (1) and (2) above. This way, at the times when you note the "chirp" problem with serial commands, you should hear a doubled beep for a single button pressing.

4. If you would try to change the antenna under RF power flowing through the switch contacts, you would get a continuous "beep" until you disable the power. You would note the contact self-guarding system of the switch. If you would not get any measure in 10 seconds, the "beep" would stop but the antenna would not be changed and the switch would wait for a RF pause or a new command to switch.

The bottom line would be that you should not be worried by the "chirp" effect. If you however find it annoyable, you may change in the switch box the resistor R17 from 47k (existing) to 33k (or place another 100-120k in parallel to the existing resistor). This would diminish the 130-ms period by another 30% in order to "distribute" the existing timing margins in a more favourable way. The round switch box however is not easy to be opened, so please inform me to tell you some tips about how tho do that.

Subject: 2000S 'chirp'?

Hi all!

I send serial commands to my 2000S, much like the 2000A would when it changes antennas. Recently the 2000S started 'chirping' when it changed antennas. If you manually press the up/down buttons, it always makes a chirping sound when it changes antennas. When it receives serial commands, it doesn't always - some times it does, other times it doesn't. Anyone know what the rule is?

-Brian n8wrl

Topic: 720 Message: 720

Hi ,
1. To connect a PC to the ACOM2000 system you need one or two "null modem" cables. A home-made cable description is shown below.

a) If you will control only the linear amplifier ACOM2000A, connect a "null modem" cable from the RS232 serial port (COM1 or COM2) of the PC, to the RS232 serial port of the amplifier (marked "RS232 INTERFACE" on its rear panel).

b) If you will control only the antenna selector ACOM2000S (plus ACOM2000SW antenna switch), connect a "null modem" cable from the RS232 serial port (COM1 or COM2) of the PC, to the main RS232 serial port of the antenna selector (marked "AMP" on its rear panel). Move the slide switch to point to "AMP". In fact, when an amplifier is not used, the PC is connected on its place.

c) If you will control both the linear amplifier ACOM2000A and the antenna selector ACOM2000S (plus ACOM2000SW antenna switch), you will need two cables. Connect a "null modem" cable from the RS232 serial port of the amplifier (marked "RS232 INTERFACE" on its rear panel), to the main RS232 serial port of the antenna selector (marked "AMP" on its rear panel). Connect a second "null modem" cable from the RS232 serial port (COM1 or COM2) of the PC, to the second RS232 serial port of the antenna selector (marked "PC" on its rear panel). Move the slide switch to point to "PC".

2. A "null-modem" type cable can be home-made or you can buy it readily, but you must cut all extra connections if available. ONLY(!) the connections listed below should remain connected there since extra signals, including +/-18VDC appear on other contacts of the amplifier, that could disturb the PC operation.

A shielded 3-core cable must be used, with two DB9-F interface connectors (female 9-pin). Pins #2 and #3 must be cross-connected, while pins #5 are straight-connected as shown below. If your PC uses a a 25-contact connector, please note that the pins are different. The cable shield is to be always connected to the connector's metal case to be grounded.

female CANNON-DB9----female CANNON-DB9------female CANNON-DB25-----Signal Nam

(ACOM2000A)----------(COM1 - PC)------------(COM2 - PC)-----------(ACOM - PC)

nr. 2-----------------nr. 3------------------nr. 2-----------------RxD-TxD

nr. 3-----------------nr. 2------------------nr. 3-----------------TxD-RxD

nr. 5-----------------nr. 5------------------nr. 7-----------------Signal Ground

metal case------------metal case---------metal case + nr.1---------Cable Shield

NOTE - Do not forget to connect the shield braid on both cable ends!

3. Always use to apply mains power to the antenna selector the first. Switch off the antenna selector the last. When the antenna selector is powered OFF, all antennas are grounded and you cannot receive nor transmit.

When you begin working:

a) Turn ON the antenna selector - number "1" must begin blinking on its LED indicator. In this state you may use the transceiver barefoot (with amplifier off). Only PC or manual antenna control is possible in this situation (from UP and DOWN buttons of the selector).

b) Turn ON the amplifier and wait for 150 seconds. Please don't change antennas while the amplifier is warming-up. You may still use the transceiver barefoot with the last selected antenna during this period.

c) After the amplifier gets ready (after you hear a CW "R" from RCU), the last used antenna number must appear (yet not blinking) on the antenna selector's LED indicator. You can go to OPERATE now.

Krassy

722. Re: Key in Key out for Tentec

Yahoo group: acom-list (1999 — 2009)
Date: 2002-01-15 21:30:54 UTC
From: aa1nd@aol.com
Topic: 722 Message: 722

Yes, you can use the KEY-OUT signal as you suppose. It is an extra T/R-control output from the amplifier. More information about the connections KEY-IN and KEY-OUT follows below.

Both amplifiers ACOM1000 and ACOM2000A are QSK-compatible with all QSK-capable transceivers on the market. The only limitations are the electrical specifications of the signals KEY-IN and KEY-OUT. The keying circuit requirements for the ACOM1000 and the ACOM2000A are identical.

1. The amplifier's T/R-control input for the antenna relay is called "KEY-IN". When in OPERATE mode, on this input appears a DC signal that is to be held low to activate the amplifier to the transmit mode. This can be done via either a relay contact or a semiconductor (transistor or integrated circuit) with suitable polarity (plus to the ground).

NOTE: You should prefer a semiconductor output when it is available on your transceiver, since relay contacts on some models are slow with respect to their RF output. You may see a "Hot-Switching Warning" or "RF detected at wrong time" message otherwise. This message means that an eventual hot switching has been prevented by the amplifier's protection system. You should change to the semiconductor output in such conditions. In addition, utilizing the semiconductor output, you may disable the transceiver's relay clicking (on some models there is a switch intended for a case when the relay is not needed).

The electrical specifications of the amplifier's KEY-IN input are as follows:

- Switching voltage (open circuit) - 15V max, plus to the ground;

- Closed-circuit current - 15mA max;

- Voltage drop / resistance of the control output @ 15mA (closed circuit) - 1.5V/250 Ohm max.

You can control the KEY-IN signal in two different methods. Look at (3) for a second way.

For the preferred mode, you have to connect the KEY-IN socket to the transceiver's output that goes to the ground when you transmit. Practically all transceivers have such an output, and their electrical specifications exceed the amplifier's requirements. Transceivers producers give different names to this output, and they are for instance: TX-GND, SEND, *T/R-LINE, KEY-OUT, etc.

Some transceivers require that their signal "ground on transmit" be implemented via a software command, or by changing of a switch on the rear panel, or interior of the transceiver. Some models generate a "+12V on TX"

signal. Then, you may need a simple n-p-n or n-mos transistor, controlled through a 10kOhm resistor to the base or gate, in order to "invert" the available signal in a "GND on TX". Look in your transceiver's manual or contact your dealer or ACOM directly for details about a particular model.

Please use always shielded cables for these connections.

2. The KEY-OUT socket on the rear panel is a "phono" type (RCA) connector. When you don't use the second method of the connection (see p.3), this is an extra output signal from the amplifier, that could be either used or not. When used, it would improve the T/R process of switching and would increase the exploitation reliability.

The KEY-OUT output is usable when the transceiver has available a respective input to disable transmitting when the amplifier may need it. If your transceiver has no such input, or you use the second way of the KEY-IN connection (p.3), please don't worry: the amplifier will be fully protected and will function normally, so the KEY-OUT may remain unused. If your transceiver however possesses a suitable input that is capable to disable transmission, we recommend that you utilize that feature. Just connect this input of the transceiver to the KEY-OUT socket of the amplifier.

Transceiver producers give different names to this input, and they are for instance: TX-INHIBIT, MUTE, LINEAR, KEY-IN, etc. It is available sometimes on BAND-DATA, ACC, EXT, LIN, ATU, and etc rear-panel connectors. Some transceivers may require that a "transmit disable" function is implemented via a software command, or by changing of a switch, or via adding an external pull-up resistor, etc. Look in your transceiver's manual. You have to use the preferred connection of the KEY-IN socket (p.1) to utilize this feature.

The output KEY-OUT of the amplifier is an open-drain circuit and it can hold a positive DC signal to the ground. During all the periods when the amplifier is ready to transmit, this line will always pattern the requests "GND on TX" in order to enable transmission. When transmitting is not permissible, the output becomes open (for instance, while the antenna relay is in process of switching-over) and the transceiver would stop RF driving.

The electrical specifications and timing of the amplifier's KEY-OUT output are as follows:

- Switching voltage (open circuit) - up to +50V,

- Switching current (closed circuit) - up to 20mA,

- Internal resistance @ 20mA (closed circuit) - 120 Ohm max,

- Delay time - 5ms max (2...3ms typically).

While the amplifier is not powered, and in STANDBY mode, this output is directly connected to the KEY-IN socket. Thus, the amplifier will send back the "ground on transmit" signal to the "TX enable"-input of the transceiver always during OFF and STBY modes in order not to disable any transmission.

In OPERATE mode the signal KEY-OUT will pattern the signal "ground on transmit" that is coming on the socket KEY-IN, always when the antenna relay is in safe position and when no other warning is present. The signal KEY-OUT will reject transmitting if the amplifier detects any risk condition.

Besides, the amplifier contains an independent self-protection that looks after the relay safety during a T/R-switching, regardless of taking or not an advantage of the KEY-OUT signal.

3. If your transceiver has not a suitable connector providing an output signal "ground on transmit" nor "+12V on transmit", you can use the second connection method as described below.

Connect the PTT or CW-keying contact to the amplifier's socket KEY-IN on the rear panel. Then connect the amplifier's socket KEY-OUT to the input PTT or CW-KEY of the transceiver. Always use shielded cables for these connections.

CAUTION: Please check up, that the parameters of the signals PTT and CW-key of the transceiver met the specifications of the "KEY-OUT" output of the amplifier (see p.2 above). Some very old transceivers models may require buffering if the requirement is higher than 50V/20mA.

With the second way of connection, the amplifier will just pass the PTT or keying signal directly to the transceiver always when powered off and during STBY mode. During OPERATE, the signal will pattern your PTT/keying after the antenna relay reaches a safe position, and will disable transmission during relay's motion as well as during any risk condition.

The second way of controlling the transmit/receive process could be very useful also if the transceiver has an incorrect timing sequence of its T/R signals. For instance, if the RF power appears before a "ground on transmit" is fed to the amplifier.

Please don't hesitate to contact ACOM again in case of necessity.

Hi Howard!

It should be the same as my 990 and the 1000MP. Check out Krassy's response on this subject in message #91 here:

Howard,
TX-Gnd on FT-1000 to Key-in on Acom...both RCA type jacks.
If this rig has never before been used with an amplifier, you might need to activate the relay by turning on the switch (S1002) under the bottom cover.
See page 9 of the manual for location.

Ust the TX to Gnd. No PTT line.

There is a switch inside the FT-1000D that you may have to move to ON, in
order to activate the output relay. It´s in the manual.

The TX-GND relay is usually off in order to make operation more quiet.

Enjoy your new radio. It´s still the best around!

Howard,
No need to turn on the relay. The transistor switch in the 1000D will
handle the switching fine, and is a lot less noisy than a relay!

From: Barry
Topic: 723 Message: 731

Marcelo,
I use pin 8 (LINEAR) of the band data DIN jack and GND to the amp.
You can also use the TX GND phono jack. See page 18 of the FT-1000
manual for details, listed under (5) Phono Jack. When S1002 is OFF,
the internal transistor keys the amp. You should only need the relay if
your amp uses high voltage at the key jack (like SB-220).
73,
Barry

From: ka7gkn
Topic: 732 Message: 732

Hi gang, Does anyone know a source for touch up paint for the 2000A??
I have the typical use scratches or nicks from use and I'd like to
touch them up.
I can't even define the color.

any help will be appreciated.

Marty ka7gkn ka7gkn@...

I have no clue what the colors are either.

I'd suggest that you look in a good quality hobby shop that carries a large assortment of model paints. There's probably a very close match available in one of the military lines of paint colors. The small jars are only a couple of bucks and if you store them bottom up after you open it, the paint will last a long time. (This way the paint seals the jar/lid surfaces and delays drying out.)

Now, related to "typical" scratches and nicks, I've dragged my 2000A to Antigua twice and it's got no scratches or nicks on it. You must be putting yours through some pretty rough treatment!

Spending a lot of time on 20 SSB?

;-)

736. Re: ICOM and ACOM 1000

Yahoo group: acom-list (1999 — 2009)
Date: 2002-01-30 19:29:53 UTC
From: aa1nd@aol.com
Topic: 736 Message: 736

For ICOM transceivers, you should preferably use the PTT and CW keyer (and parallel computer) connected to the respective inputs of the transceiver. For amplifier control use the semiconductor control input/output "HSEND" on the round "ACC" connector of the transceiver. For some ICOM models it is named "SEND". Connect it directly to the "KEY-IN" input of the amplifier via a shielded cable. You don't need any relay between ICOM transceivers and the ACOM1000 or ACOM2000A.

Generally, the HSEND (SEND) signal on the ACC connector of ICOM models is bidirectional. If you connect it to the ground, the transceiver will go to transmit, i.e. it acts like an external PTT input. A 20mA "output" current will flow through your external PTT contact. This direction of the HSEND (SEND) however is not used for external amplifiers control. Another function of the same signal is an output, that goes to the ground when you activate a transmission using the front panel SEND button, mike PTT, VOX, or CW keyer. In this direction, it will withstand 100-200mA "input" current (drawn from amplifier's control input) and is suitable to control ACOM amplifiers.

If you would simply wire the CW key line from your keyer (and parallel computer) directly

to both the Icom and the A1000 (in parallel), the amplifier would be OK. Most of the ICOM models would however only change to transmit but without emitting any carrier (they would wait for a closure of their input "CW KEY"). For SSB, such connection is OK to a foot switch. Note however, that the foot switch should be bounce-free since some asynchronous timing may arise. You could also use the foot switch for CW, with the keyer connected to the transceiver's "CW KEY" input. You will lose however the possibility of operation in QSK/FULL-BK-IN mode.

More information about the connections KEY-IN and KEY-OUT follows below. Briefly, the amp is keyed by grounding the KEY-IN jack. The keying voltage is typically 12VDC and the keying current is less than 15mA. Both amplifiers ACOM1000 and ACOM2000A are QSK-compatible with all QSK-capable transceivers on the market. The keying circuit requirements for the ACOM1000 and the ACOM2000A are identical.

1. The amplifier's T/R-control input for the antenna relay is called "KEY-IN". When in OPERATE mode, on this input appears a DC signal that is to be held low to activate the amplifier to the transmit mode. This can be done via either a relay contact or a semiconductor (transistor or integrated circuit) with suitable polarity (plus to the ground).

NOTE: You should prefer a semiconductor output when it is available on your transceiver, since relay contacts on some models are slow with respect to their RF output. You may see a "Hot-Switching Warning" or "RF detected at

wrong time" message otherwise. This message means that an eventual hot switching has been prevented by the amplifier's protection system. You should change to the semiconductor output in such conditions. In addition, utilizing the semiconductor output, you may disable the transceiver's relay clicking (on some models there is a switch intended for a case when the relay is not needed).

The electrical specifications of the amplifier's KEY-IN input are as follows:

- Switching voltage (open circuit): 15V max (12V typ.), plus to the ground;

- Closed-circuit current: 15mA max;

- Voltage drop / resistance of the control output @ 15mA (closed circuit): 1.5V/250 Ohm max.

You can control the KEY-IN signal in two different methods. Look at (3) for a second way.

For the preferred mode, you have to connect the KEY-IN socket to the transceiver's output that goes to the ground when you transmit. Practically all transceivers have such an output, and their electrical specifications exceed the amplifier's requirements. Transceivers producers give different names to this output, and they are for instance: TX-GND, SEND, *T/R-LINE, KEY-OUT, etc.

Some transceivers require that their signal "ground on transmit" be implemented via a software command, or by changing of a switch on the rear panel, or interior of the transceiver. Some models generate a "+12V on TX" signal. Then, you may need a simple n-p-n or n-mos transistor, controlled through a 10kOhm resistor to the base or gate, in order to "invert" the available signal in a "GND on TX". Look in your transceiver's manual or contact your dealer or ACOM directly for details about a particular model.

Please use always shielded cables for these connections.

2. The KEY-OUT socket on the rear panel is a "phono" type (RCA) connector. When you don't use the second method of the connection (see p.3), this is an extra output signal from the amplifier, that could be either used or not. When used, it would improve the T/R process of switching and would increase the exploitation reliability.

The KEY-OUT output is usable when the transceiver has available a respective input to disable transmitting when the amplifier may need it. If your transceiver has no such input (for instance ICOM models), or you use the second way of the KEY-IN connection (p.3), please don't worry: the amplifier will be fully protected and will function normally, so the KEY-OUT may remain unused.

If your transceiver however possesses a suitable input that is capable to disable transmission, we recommend that you utilize that feature. Just connect this input of the transceiver to the KEY-OUT socket of the amplifier. Transceiver producers give different names to this input, and they are for

instance: TX-INHIBIT, MUTE, LINEAR, KEY-IN, etc. It is available sometimes on BAND-DATA, ACC, EXT, LIN, ATU, and etc rear-panel connectors. Some transceivers may require that a "transmit disable" function is implemented via a software command, or by changing of a switch, or via adding an external pull-up resistor, etc. Look in your transceiver's manual. You have to use the preferred connection of the KEY-IN socket (p.1) to utilize this feature.

The output KEY-OUT of the amplifier is an open-drain circuit and it can hold a positive DC signal to the ground. During all the periods when the amplifier is ready to transmit, this line will always pattern the requests "GND on TX" in order to enable transmission. When transmitting is not permissible, the output becomes open (for instance, while the antenna relay is in process of switching-over) and the transceiver would stop RF driving.

The electrical specifications and timing of the amplifier's KEY-OUT output are as follows:

- Switching voltage (open circuit) - up to +50V,

- Switching current (closed circuit) - up to 20mA,

- Internal resistance @ 20mA (closed circuit) - 120 Ohm max,

- Delay time - 5ms max (2...3ms typically).

While the amplifier is not powered, and in STANDBY mode, this output is directly connected to the KEY-IN socket. Thus, the amplifier will send back the "ground on transmit" signal to the "TX enable"-input of the transceiver always during OFF and STBY modes in order not to disable any transmission.

In OPERATE mode the signal KEY-OUT will pattern the signal "ground on transmit" that is coming on the socket KEY-IN, always when the antenna relay is in safe position and when no other warning is present. The signal KEY-OUT will reject transmitting if the amplifier detects any risk condition.

Besides, the amplifier contains an independent self-protection that looks after the relay safety during a T/R-switching, regardless of taking or not an advantage of the KEY-OUT signal.

3. If your transceiver has not a suitable connector providing an output signal "ground on transmit" nor "+12V on transmit", you can use the second connection method as described below.

Connect the PTT or CW-keying contact to the amplifier's socket KEY-IN on the rear panel. Then connect the amplifier's socket KEY-OUT to the input PTT or CW-KEY of the transceiver. Always use shielded cables for these connections.

CAUTION: Please check up, that the parameters of the signals PTT and CW-key of the transceiver met the specifications of the "KEY-OUT" output of the amplifier (see p.2 above). Some very old transceivers models may require buffering if the requirement is higher than 50V/20mA.

With the second way of connection, the amplifier will just pass the PTT or keying signal directly to the transceiver always when powered off and during STBY mode. During OPERATE, the signal will pattern your PTT/keying after the antenna relay reaches a safe position, and will disable transmission during relay's motion as well as during any risk condition.

The second way of controlling the transmit/receive process could be very useful also if the transceiver has an incorrect timing sequence of its T/R signals. For instance, if the RF power appears before a "ground on transmit" is fed to the amplifier.

73 Krassy K1LZ

Hello all,
This morning while I was transmitting on 40m SSB the protection from my Acom 2000 jumped and shut off the amp with this warning:
IG1= 3.6mA
SHOULD BE ZERO

Every time I starts the amp jumps the protection with this warning.
I was operating in normal conditions, the antenna has SWR 1.0, could be a bad valve?
Best 73, Jaime EA6NB. <ea6nb@...>

My Acom is again working, thanks to Acom support, they have been great, I wanted to make the repair myself if possible, just send me all the information necessary and possible element failure, I did the measurements they require and replace a Transistor MosFet which I could find in any electronic shop in Palma (this is great not rare components very difficult to get) and the Acom2 is prepare for VP8 on 80M tonight if they came out!

The problem was the Bias Control kaput.

Thanks Acom for the extraordinaire support and great amp.
73's Jaime EA6NB.

Interesting....my bias control transistor failed as well. A three-state stepped bias is used in the ACOM 2000A. In my case, I
noted that full the full output biasing state was not being achieved and it took about 90-watts of power in order to produce
1500-watts output. Replacing the transistor corrected the problem.

I got the grid current message shortly after receiving my amp (and after replacing the bad T/R relay, which was sticking.) The guys at the factory thought it was the bias transistor, but I think it was a shorted grid in one of the tubes. I'm not completely clear on this because I'm not sure whether Krassy replaced the tubes *and* the transistor when he did the repair. My vague recollection is that he said it was a bad tube.

Paul and Jaime, for future reference, please tell us the replacement part for the bias transistor. Might be good to have one on hand, especially if it's a common part. Where is the transistor located in the amp? Did you have to readjust the tube bias when you replaced the transistor?

Dick,

It's been two years since the occurrence and I no longer have that documentation. Yes, after the component change, there are two trim pots to adjust in order to properly set the stepped bias.

Ok, but I would not touch anything at all without the help of Acom,
they provide all the information necessary and I don't think this
fault will repeat to others.
Before replacing anything you have to be sure is a defective
component, so you have to measure the voltages around the suspicious
part, another good thing of this amp is that only with the CPU ON you
can measure V at the interface board without lethal HV.
Also if you are going to repair it by yourself you need some practice
substituting components and soldering, if not leave it to a friend
who knows.
Well in my case was Q9 (IRF-630 mosfet) on the INTERFACE BOARD,
after replacing it, I measured the ☐125V (correct value of BIAS
output) at the proper pin at the board, not necessary in this case
any pot adjustment.
The support of Acom makes me quite confident if (hope not, but amps)
I have a future failure. I had faults in other amps much more simples
like TL922, L7 etc., with no support at all, repair them was not easy.
73, Jaime EA6NB.

743. touch up paint information

Yahoo group: acom-list (1999 — 2009)

From: ka7gkn
Topic: 743 Message: 743

I dropped Krassy a note asking about the color and availability of touch up paint for the 2000A. I chipped a small edge on my RCU...it was My fault!!!

Anyway, the good news is the paint technique for the main box and rcu is "powder coating" so it should wear really well and not be a problem.

The color at this time is not really identified and I'm going to check out the hobby stores for something close to match.
When I locate a name and source for the color I'll pass it along.

Krassy replied quickly which was very nice.

In today's world of lack of true customer support we are really lucky to have Krassy take a personal interest in each amp!

regards... Marty ka7gkn@...

Krassy is very responsive.

One idea I had but forgot to mention, what if you took the RCU to a good paint store and have them use that 'optical' system to match colors? I think it is usually used for house paint but perhaps you they can use it with something else more specialized. At least you could get the 'magic numbers' for paint mixing.

745. Acom 2000a For Sale

Yahoo group: acom-list (1999 — 2009)
Date: 2002-02-12 16:01:55 UTC
From: Richard Thorne
Topic: 745 Message: 745

Hi Guys:

Hope you don't mind if I post this.

Acom 2000A for sale. Purchased 07/99 so the warranty runs through 07/2003.

Excellent condition electrically and cosmetically. I can send digital pictures if your serious.

$4500 plus shipping.

Hi Al:

Its still the best amp on the market.

I'm just losing interest in the hobby. I'm going to tone the station down
and put up a stealth antenna at my home qth which is heavily restricted.

748. "Low Gain" Fault on 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2002-02-18 00:15:43 UTC
From: Brian, N8WRL
Topic: 748 Message: 748

Hi all!

I had a weird thing happen during ARRL CW this weekend. I had made some SWR-related adjustments to one of my tribanders but it wasn't major. I had planned to re-auto-tune for that beam, but didn't do it yet.

After several hours of operating normally, I noticed it was taking more and more drive to get the same output from the amp. After a bit, I started getting 'LOW GAIN' faults on a couple bands. The manual says to check the COAX and auto-tune.

I've since re-auto-tuned all bands on all antennas and I haven't seen the fault again. Anyone know what causes this and why it would start happening like this?

Thanks!

-Brian n8wrl

Brian,

Simply put, the amp was not tuned to resonance with the new load.
Output suffers and it takes more drive to produce the "same" output.
Consider it being like tuning the amp in the CW band and then trying
to use the amp in the phone band. It won't have the same output even
if the load is the same.

Note there is a nearly infinite number of ways to get the same swr.
A z =25 ohms or z=100 ohms both give SWR's of 2:1. However, the amp
tuning required to match these two is much different. Throw in
complex impedances and it gets worse.

HI Brian!

Long time no chat - thanks for the quick response!

Well, that certainly makes sense for the beam I made changes too, but it happened on antennas I hadn't mucked with in some time! For example, the beam I worked on was a tribander at 35' fixed on EU. I saw the same fault while using my XM240 40m beam too!

I'll have to keep an eye on it over the next few weeks to see if the 'retuning' on all bands and antennas 'fixed' it.

It happened again! This time on 15m. It's as if the amp is forgetting its tuning settings - I've had the amp for about 14 months - how long should the memory battery last, if there is one? I usually leave the amp 'off' with the main power switch. Re-auto-tune and all is well, for now?

Anyone use AcomTools during contest? I forgot all about it. Wonder
how it worked out?

INSTRUCTION for Mains Voltage Selection in ACOM1000

NOTE: This instruction is applicable only for units produced after January 01, 2002.

W A R N I N G HIGH VOLTAGE!

The amplifier works with high voltages up to 3000V, which are LETHAL! Also, for your safety, pull the amplifier power plug out of the mains wall outlet and WAIT AT LEAST 30 minutes EACH TIME BEFORE you remove the cover of the amplifier. Do not touch any part inside because some residual voltages may still be present.

1. Removing the top cover.

Using a Philips-2 screwdriver, unscrew 9 pcs of "Eco-fix" flange-button head screws to release the top cover (2x3 pcs on each bottom-side edge, and three more on the rear-top edge of the box). Don't unscrew four screws that hold the grid above the tube.

Lift the rear edge of the cover slightly (to 2-3cm) and then pull the cover backwards, in order to release it from front-panel's chutes. Remove the top cover.

2. The MAINS PCB is located just above the big HV transformer. Find 8-contact terminal block where the HV transformer's leads are connected. Numbers and letters "8-4-U-V-W-W-X-X-X-X" on the PCB indicate the contacts. These contacts are for the HV-transformer mains voltage. The transformer's mains taps are indicated by figures 1 through 8 (yellow cable markers).

3. On the same PCB, find also 2x5 contacts header with three short-circuiting jumpers (links) placed on it. Its contacts are indicated by the letters "A-B" and numbers "1-2-3-4-5". These jumpers are for the mains voltage of the LV transformer.

4. Look at the "Mains Voltage Selection" table that is stuck below the cover. Select the table row corresponding to your new Mains Voltage.

a) Find the short-circuiting jumpers' pattern that is shown next to your voltage (in the column "LV Transformer"). Compare it to the real jumpers' pattern on the PCB. If it is different, arrange the jumpers (use tweezers). Note that the patterns for 100-110V are identical (as well as for 210-220V, and 230-240V).

b) Arrange the HV transformer's taps according to the next 8 cells on the same table row. Use a screwdriver with a flat tip of 3.5x0.7mm (0.135x0.027") approximately. Note that taps 8 and 4 are always on contacts 8 and 4 correspondingly. Also, the letters W-W are interchangeable, as well as the

letters X-X-X-X are.

c) Remove the mains fuses (located on the rear panel) and see their nominal current marking. For 100-120VAC you would need 20A. For 200-240VAC the fuses must be 10A. Replace the fuses if different.

5. Check the LV short-circuiting jumpers and the HV transformer's taps again before installing the top cover.

6. Installing the top cover.

a) Put the cover above the chassis holding its rear edge slightly lifted (to 2-3cm). Align its horizontal and two vertical front edges to the respective front-panel chutes. Then push gently the cover forwards, in order to insert its front edges into the front-panel's chutes. Take care especially to the bottom corners.

b) Screw in loosely all 9 pcs of "Eco-fix" flange-button head screws. Use a Philips-2 screwdriver.

c) Pressing continuously the cover forwards and to the bottom, tighten all 9 screws properly.

Best 73!

Sofia, 20 February 2002.

From: Richard Thorne
Topic: 760 Message: 760

Hi Guys:

Whats the word on the 1000a amplifier? I like the idea that it covers 6 meters. What kind of power output can be expected? 1000w, 1200w? Anyone use it for rtty, i.e. continuous duty?

I sold my 2000a for a bunch of reasons, mainly because it wasn't getting used since it sat here at my office where the tower is.

I just purchased a 756pro with long wire antenna tuner for home, but would still like a decent amp at the office for the 2 or 3 times I would use the station for contests.

I don't think I'll feel as bad having a $2500 amp sitting most of time v.s. $5500 :-).

Richard,

I used a Acom 1000A in Antigua last fall for the CQWW SSB from Antigua as V26B on 15m.

I covet one now.

It puts out 1200w if you tune it carefully - and this is pretty easy to do so don't think I mean that this is a problem - it's just that I know you're used to no tuning, so it's somewhat less convenient.

We took it out of the box, installed an AC plug on the power cord, turned it on and operated the contest making about 5,000 qsos. After the contest we turned it off, and put it back in the box.

It was as simple as that!

It's made the same way as the 2000 (perfectly) and is protected from all possible damage just like the 2000.

Highly recommended!

73,

Bob N5NJ / V26O

On the Acom 1000A amp unit, does the xformer need to come out to
ship it?

Do they give any discounts at Dayton Hamvention on orders?
Thanks to all.

no,

all is installed from factory. just install the AC plug on the power cord.
I agree with all comments here, love my 1000, easy tuning proces, puts out 1150 watt CW (55 wt drive) and around 1100 watt ssb (60 watt drive).

The amp is qiet, that's a real comfort in the shack and does the job very easy.
I ran it on SSVT several times driving it 30 watt having 750 watt on the antenna, no problems even not after several images has been transmitted.

From: n4py
Topic: 765 Message: 765

The QSK timing scheme between the Acom 1000 and the TenTec Omni VI, Omni V, Pegasus, and Jupiter are perfectly compatible with each other. All you have to do is connect the tentec "TXOUT" to the Acom "KeyIn" and connect the Acom "KeyOut" to the tentec "TX EN". This results in perfect QSK timing and works great.

Barry,

I used it for a while and it works as advertised. Unfortunately, the algorithm used by the frequency switching extension isn't quite what I need for my SO2R setup. I think the extension was designed for a M/S or M/2 operation where a single amp is shared. I was trying to use it in a standard SO2R setup with two amps -- one radio was using an Alpha 87A and the other was using the Acom 2000A.

The problem I was trying to solve is this: when you use Writelog's advanced SO2R switching (i.e., call CQ with Auto Restart on one radio and drop your call in on the second radio), and you have just changed bands on the second radio, you can lose several CW elements while the 2000A autotunes to the new frequency. It's fairly time consuming to get to the new frequency segment manually from the RCU panel when you do the band change (especially if the bands are far apart.) The ideal solution would be for the 2000A to follow whatever frequency is set on the second radio.

The frequency switching extension almost solves the problem: it sets the 2000A to the frequency of the radio that has the keyboard focus. This works great when the focus is split (transmit focus on the run radio and keyboard focus on the S&P radio.) But when you put the keyboard focus back on the run radio, the 2000A follows it and sets itself to the run frequency. From an operational standpoint this is OK -- it switches back when you split the focus again. But the sound of the amp retuning itself a lot is annoying and makes one wonder how long the motors will put up with that. Also, sometimes I switch to running on the second radio and doing S&P on the run radio. In that case, I had to stop AcomTools. Otherwise it would retune itself to the S&P frequency while calling CQ!

I finally decided to kill AcomTools, and run it only after I did a band change on the S&P radio. I later realized that I could have kept it running, disabled the frequency switching extension, and simply used the manual band selection menu. That's a quick way to retune the amp after a band change. That's the way I'll do it in the next contest.

It would be neat if there was an option to do the frequency switching only if the focus is split.

768. 87A vs 2000A (was Re: Anyone use AcomTools during contest?)

Yahoo group: acom-list (1999 — 2009)
Date: 2002-02-24 20:03:29 UTC
From: dickgreen03755
Topic: 758 Message: 768

I've had the 87A since 1995 and the 2000A for about a year. It's too close to call -- they're both superb amps with exceptional design and build quality. Both are real workhorses.

87A advantages: Silent PIN diode T/R switching (quiet and no relay to wear out from heavy QSK usage), perfect design for QSK, AlphaMax dynamic autotune (perfect for multiple antennas per band), AlphaRemote remote control software, low-power transmission passed through during band change retuning (no CW elements lost), manual tuning (for more precise stored presets), designed for remote operation via cable or modem, reliable 3CX800A7 tubes, virtually no transformer hum, blower quiet enough for desktop use.

87A disadvantages: SWR must be < 2:1 (output network and PINs can't handle more), autotune not reliable for storing presets (manual tuning very time consuming), firmware is dated and can't be expanded, error reporting is often misleading, tubes very expensive to replace, blower much noisier than 2000A, external optional fan very noisy.

2000A advantages: comfortably handles SWR up to 3:1, fast accurate and easy autotune for storing presets, excellent QSK design for a relay-based amp, RCU well designed and saves lots of desk space, more advanced fault detection, terrific error reporting (sometimes misleading like 87A, but at least a generation better), Russian tubes much cheaper to replace, blower incredibly quiet (the new one), DOS-based autotune program fantastic for automatically retuning all segments, AcomTools has some nice features.

2000A disadvantages: no dynamic autotune (must manually select different tuning preset for each antenna), no transmission during band change retuning (CW elements lost), not fully designed for remote operation via cable or modem (power on/off is a problem and AcomTools is still evolving), relay can wear out under heavy QSK usage, relay switching slightly noisier, no manual tuning (actually I'm not sure about this and not sure it's needed), some transformer hum (might be able to reduce that by playing with voltage taps but haven't tried), no vendor-supplied remote control software (though AcomTools is getting close to AlphaRemote's capabilities), no Windows-based software to automatically retune all segments, Russian tubes *might* be less reliable.

Last I experienced it, service was excellent from both companies.

I think anyone would be very happy with either amp. Hope this comparison is useful.

Hi Dennis. I have been using that combo for over a year. Works great! I am now at KP2 for a week, so if you would like details it may have to wait till I get back. I may not be checking email much while I'm here. The radio and golf will get in the way of that.

From: Dennis Vernacchia
Topic: 771 Message: 771

Has anyone purchased a matched set of 4CX800As from Tom's Tubes
W4TH (Tom Hix) and installed them in their ACOM 2000A ?

Thinking of getting a spare set and wondered if anyone can verify
quality
and how they worked?

Also, is there any great reason to buy a spare set of sockets for

teh 4CX800As. What would anyone think the sockets would last in
tube hours?

FYI, when you replace the tubes you have to readjust the bias (or is it the idle current?) Anyway, you can get a written procedure for that from Acom.

779. Re: [acom-list] ACOM 2000A Key Out Jack

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-04 12:37:02 UTC
From: Carl Moreschi
Topic: 772 Message: 779

Dennis,

The TenTec radios are all set for QSK. Their amplifiers have a QSK scheme
that turns out to be identical to the ACOM scheme. You connect the tentec
"TX OUT" to the ACOM "Key In". You then run the ACOM "Key Out" back
to the tentec "TX EN".

TenTec radios are such that when you key them, they cause "TX OUT" to go to
ground.
When "TX EN" goes active to ground, they then start transmitting. This
allows
time for the amplifier's antenna relay to transfer because the tentec radio
will not transmit
until TX EN is ground.

Yaesu works the same way. This was confusing to me at first because it's the _radio_ pulling 'TX OUT' to ground and then, after passing thru the loop, it's the radio again detecting the grounded TX-IN. It's neat because ACOM's antenna switch can be part of the loop too, so the rig won't send RF until the switch _and_ the amp are happy!

782. AcomTools and Writelog

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-06 00:09:45 UTC
From: N0AT
Topic: 665 Message: 782

I used the Acom tools with Writelog during the DX contest last weekend. It was nice to have the amplifier follow the radio without having to put out any rf.

When I grabbed a spot that contained a split frequency I noticed the amplifier switching back and forth from the split frequency to the receive frequency. This happened approximately every second. When the receive/transmit frequencies were in different amplifier segments, the tune motors would go back and forth, approximately every second. This is unnecessary wear and tear on the motors.

Is there any way to make the amplifier stay put on the split frequency? Maybe this is unique to my station, I'm running an IC-775, and no Acom antenna selector. I have the latest version of Writelog and Acom tools.

Ron,
I used Acom Tools as well, and it worked perfectly. I'm using Writelog with FT-1000D. My guess is it has something to do with the way WL communicates the freq info to the radio (changing freqs each time the radio is polled?), as Acom Tools gets the data from WL.

This whole issue of controlling the radio, the amp, the antennas has me completely confused. I intend to try to automate my station, perhaps SO2R as well.

As far as I know there are two possible sources of information to do the switching...on the ICOM series there is the CI-V line, which provides the exact frequency and on the AUX connector there are voltage levels. There are problems with each. The CI-V line, at least on the latest ICOM758Pro2 does not appear to output the frequency when the radio is set from the keypad, or perhaps output the frequency periodically. I could be wrong on this, I have not looked at it on a scope as yet, so I will say this is just a guess.

The AUX line provides voltages, but unlike the Kenwood, the 80/75 meter band has a single voltage, and this is a band where it is difficult to work the entire band without at least a antenna tuner device, perhaps fixed which could be switched in and out depending upon frequency selected.

I believe some antenna switch systems attempt to solve the first problem by interrogating the radio rather than waiting to intercept the information.

Has ACOM a solution for these issues?

Subject: [acom-list] AcomTools and Writelog

I used the Acom tools with Writelog during the DX contest last weekend. It was nice to have the amplifier follow the radio without having to put out any rf.

When I grabbed a spot that contained a split frequency I noticed the amplifier switching back and forth from the split frequency to the receive frequency. This happened approximately every second. When the receive/transmit frequencies were in different amplifier segments, the tune motors would go back and forth, approximately every second. This is unnecessary wear and tear on the motors.

Is there any way to make the amplifier stay put on the split frequency? Maybe this is unique to my station, I'm running an IC-775, and no Acom antenna selector. I have the latest version of Writelog and Acom tools.

OK Carl,

Interesting scheme but won't do much for my TS-950SDX!

Carl,

I still don't understand. I have an external electronic keyer I
use,
the internal keyer in teh 950 is of no use to me for my contest station
hookup.

So where do I connect the output of my external keyer and where does the
the keying line that currently hooks to my Key IN Jack on the 950 come
from.
What does each cable come from that plugs into the Key IN and Key Out
jacks
on the back of the ACOM 2000A ????

Dennis,

I used the ACOM2000A with my TS850. (I assume the same holds for the 950). First, unlike many radios, the 850 (and TS450 and hopefully the 950) has a 20ms delay between key down and the generation of RF. This eliminates the possibility of hot switching of antenna change over relays in amps. The timing info was in the shop manual. Perhaps you can get someone who has a shop manual to confirm this.

So here's what worked.

1) Connect the key to the 850.
2) Connect the TR (not relay output) line to an inverter and then to the ACOM 2000A input. The TR signal on the 850 was +12 on xmit. The ACOM needs a short to ground. Shut off the noisy T/R relay in the xcvr.
3) Nothing attached to key out line of ACOM

I ran what Kenwood calls "full break-in" with the 850 using this method.

Dennis,

I was speaking of the TenTec keying scheme. You are correct, this method won't help you much on the 950. In the tentec keying scheme, when you key the radio,
the radio asserts TXOUT to ground. The radio will not actually start transmitting
until it sees TXEN go to ground also. So this gives you a way for your radio
to wait until the amplifier relay has transferred without having to guess at how
long it takes. When the ACOM KEYIN line is asserted to ground, the AMP relay begins to transfer. Once the relay has fully transferred, the AMP asserts
KEY OUT to ground. Since this line is wired back to the TXEN line, the radio
ends up waiting for the amp relay to transfer.

One way to wire this with any transceiver is to connect the keyer to the Acom
KEYIN line. You then connect the Acom KEYOUT line to the transceiver's KEY line. Unfortunately, this scheme only works for CW. The above tentec scheme works for all modes.

789. FS: ACOM 2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-17 20:02:02 UTC
From: k4kkl
Topic: 789 Message: 789

Hi folks,
I have decided to sell my 2000A and return to a simpler ham existence. I bought it new late Nov 1999 (sn 990316). The heater light has been coming on recently and now I've had a couple of trips at start-up (heater voltage too low 0.00V). I talked to Krassy and he said Acom would replace the faulty heater circuit connector(s) under warranty and thoroughly check the amp. I will ship the amp to Acom and then it can be shipped to you from there. It's clean - no blemishes or scratches and no tampering. The unit reports 1001h of run time Digital pics are available if you're interested. Price is $4500. Please contact me at K4KKL@...

Tnx es 73,
Mike K4KKL

790. Loss of tunings?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-17 21:53:15 UTC
From: alsopb
Topic: 790 Message: 790

Anybody else out there experience a loss of the memorized tuning settings?

I thought at first that the memory was lost perhaps due to the battery going dead. However, there is no RCU message present. The loss occurs over night. If the amp stays on, there is no loss.

All band segments show the correct indication (in my case A1 USR)

Note: At one time, I thought it was the antenna impedance changing for unknown reasons. However, the latest occurance happened on all bands -- that's five different antennas.

Is there another failure mode like bad battery socket or something?

de Brian/K3KO

I have seen this too. Had a momentary power blip during ARRL SSB, and it was enough to dump the Acom, but everything else rode through. Upon restart, all the memorized presets had been changed, perhaps back to some factory default. Took a few minutes of off time to reset the tunings.

I'd be interested in a fix for this.

792. Re: [acom-list] Loss of tunings?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-18 01:08:41 UTC
From: Brian, N8WRL
Topic: 790 Message: 792

What are the symptoms? From earlier posts I reported a problem with a 'creeping' loss where all antennas eventually had 'low gain' faults. Re-tuning them fixed it.

Stan from ACOM walked me thru numerous tests via emails but everything came up fine, and it has been fine ever since. I did not have any power failure, but it happened right after I retuned for changes in one of the beams. I think it has something to do with the amp getting commands over the serial line while it was tuning, but I haven't been able to make it happen since.

Hi Brian,

Well, it happened again this morning. While I can't completely rule out problems with antennas, their SWR appears unchanged.

This morning 40, 20, 15, 12, and 10 m were out of tune. It did result in "low gain" trips for some of the bands. On other bands the output was just about half normal. 40 m uses a beam, 20,15,10 a quad and 12M a separate quad.

I see in the manual there is a way to look at the tune and load setting in the "manual tuning" mode. It would be instructive to look at these settings when things acted up and compare to the last set of values. I have looked at them and they do vary with band segment. So perhaps they are the ones last set by the autotune.

For what it is worth, I tablulated the settings and shut the amp off
for a while.

I then turned it on and looked at the tuning/loading settings. They
were the same for a few segements that were spot checked.

However, the amps power output was way down. Going back to autotuning
and retuning brought the power back up. However, the settings
required to obtain full power were now different. For example 14050
old 82/139 new 84/133 and 28038 45/167 vs 47/160.

I'm begining to think that either the shafts are slipping or the
preset physical settings are not being achieved.

Some of the things Stan walked me thru included taking various measurements via the RCU to ensure they were in range, etc. Also, he asked me to open the unit up and look to see if perhaps a brown cable that ran from the front to the rear of the unit along the middle vertical wall had gotton hung up or otherwise impeded the motion of one of the vari-caps. Apparently they had a problem before shipping any units where this cable was just lying on the floor and got caught up in the rotors. They've since fastended it down. Nothing - everything looked fine on mine. Stan is very thorough and systematic - a pleasure to work with.

Your symptoms sure sound similar, tho - as I changed bands/segments I would see progressively less gain for the same exciter input, until I got a 'low gain' fault. Retuning that segment brought it right back but later it might happen again. Stan suggested a problem with the mechanicals getting the tune to the right place.

What I ended up doing was unhooking all my serial control stuff, clearing USR memory, and retuning all bands on all antennas. It hasn't happened since.

799. Re: [acom-list] Heater Current Too High

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-27 16:27:47 UTC
From: K4HW
Topic: 799 Message: 799

Sometimes when I turn on the 2000A at the RCU I get the message "Heater Current Too High 4.5" I turn it on again and it comes up ok. The "Mains" reads 245V from the RCU but a voltmeter shows the power to the amp to be 238 volts. The tap is on 240. The RCU shows the filament voltage at 12.7 volts and the heater currents at 3.7 and 3.8 amps.

Any Ideas?

Many thanks

Hal -K4HW

Hal:

It may be a set of bad molex connectors on the low voltage power supply board. I had the same type problem and it turned out that the molex connectors were cooked and the tubes were not getting voltage to the fillaments.

Krassy sent me a new set of Amprex (.sp?) connectors which I installed. It was a job though. The connectors are on the bottom board ands it a bear to get to as you have to dissassemble the stack of boards to get to it. But it can be done.

IF this is the problem, I'm sure Krassy will take care of it as he did for me. The only reason I did it myself was to save time with shipping ect. The amp worked fb after the surgery and the problem never came back.

From: ka7gkn
Topic: 801 Message: 801

Arizona is a dusty state! I pull the filter cover off the rear panel monthly and every two weeks during the summer to remove the dust build up. I went to Fry's electronics and found a metal type particle filter that is more durable than the thin foam we get. I have kept the foam too. but the stress on the foam is less. The metal filter is secured to the plastic cover that pops off. I used 1/4" #4-40 screws so it does not interfere with anything.

I also have tissue paper that floats above the tube chimmneys and they drop to cover them when power is off.
Normal operating temp is between 30-40 C and when transmitting the temp goes as high as 90-110 C
I blow out the filters carefully and replace them.

I have 400+ run hours on it and no problems.

803. Re: [acom-list] Heater Current Too High

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-29 15:23:53 UTC
From: k5yg@aol.com
Topic: 799 Message: 803

Do contact Krassy. There could be a more serious problem as well, associated with the Teflon insulation cold flowing in the bias transformer connector.

Intermittent Bias Transformer Connections (Early production units):
Be on the lookout for shutdown with the following error message:

BIAS TOO LOW AT TURNON

Per Krassy, this is bad, real bad! It is an indication of a known problem in early production units. The Teflon insulation cold flows into the bias transformer connector connection, where the wires attach to the connector terminals. These wires have about 1/8" of the Teflon Insulation striped off the end. The wires are not soldered to the connector, they are pressed into the terminals on top of the connector. (not crimped). The fix is soldering the wires to the pins.

Removing the main power and powering back up will clear this fault -- beware though, there is a problem that must be fixed to prevent possible loss of tubes.

Defective Filament Transformer Connector:
Look for a brown spot on the 3rd connector, to the right, on the PC board, behind the Bias Transformer.

My 2000A:
After inspection and finding burn marks on the filament transformer connector, I returned my 2000A to ACOM. Krassy replaced the connector and soldered the bias transformer wires to the connector terminals. He returned the unit to me, at his expense, very quickly.

My amplifier is an early production unit (SN 116), purchased in May 2000.

I am very pleased with my 2000A and the outstanding support from Krassy / ACOM.

I talked to Krassy about the Heater Current message. He assured me that the 2000A I had received last August was after any problems with connectors etc. He said the Mains voltage indication on the RCU should be accurate. So this time I took my Fluke 97 down and measured the power voltage. He was right. Both meters agreed exactly. It is reading 247V today so is a little higher than optimal but should be ok. I think I will ask the power company about it.

Thanks to Richard and Bill for their responses.

Just an FYI, the power company has to keep the 240v line voltage within +/-
10%. That means 216 to 264v.

You're well within that limit.

I expect that you'll see it drop pretty soon once all of your neighbors have
their A/C running full blast.

We may have that happen today here in the Dallas area.

807. Changes at ACOM International, Inc.

Yahoo group: acom-list (1999 — 2009)
Date: 2002-03-31 12:53:16 UTC
From: aa1nd@aol.com
Topic: 807 Message: 807

Changes at ACOM International, Inc.

In the past few weeks there has been some changes at ACOM, we moved from our Burlington facility to a new location, the new address and telephone numbers be:

ACOM International, Inc.
71 West Street
Medfield, MA 02052

TEL 508 359 5990
FAX 508 359 5989

Our Email address will remain the same until further notice:
info@...

We are happy to announce that Will Angenent, K6NDV became part of our team and you will be able to address questions to him.

We just received a shipment of ACOM 2000A and ACOM 1000A amplifiers, for a short time we are able to sell these amplifiers from our current stock without waiting.
The long waited for Digital Recorder/Memory Keyer (DigiRec) should be available after Dayton. We do currently have the DVP board in stock, both DigiRec and DVP board are using the same connection cable, available for different brand of radios.
We do have the ACOM 2000 SW/S and the ACOM 2S1 Automatic XCVR commutator in stock.
For more information on one these products and reviews, please visit our WebPages: http://www.hfpower.com

We will be at the Dayton HAMVENTION, our booth number will be 454, the complete KH1 team will be at our booth to give out and sign the QSL cards from their Baker/Howland Dxpedition, co-sponsored by ACOM International, Inc.

Please give us a call or stop by at our booth 454 in Dayton.

Thank you 73,

Krassy Petkov, K1LZ
Will Angenent, K6NDV

808. Heter Voltage Too Low

From: ka7gkn
Topic: 809 Message: 809

I have almost 500 hours on the 2000A and aside from cleaning the foam filter in back the unit is perfect. I do admit I usually only run at idle [500w] ha ha but there are times the full 1.5kw is required!

for those of you with log beams this amp is perfect for that type antenna. I use the Sommer XP707 10-40 meters log [type] multiband beam. at 70 feet. I do still require some help from an outboard antenna tuner [atr-30] when on 40 meters since there is so much capacitive reactance... the amp 1:3 ability is at it's limit the actual swr is 2.7 to 3.1 never the less, with the tuner in line with minimal settings the swr drops to 1.3 and the amp sings...

I wonder how come those of you now using the little brother 1000A have not stopped by with comments?

regards to all....Marty ka7gkn@...

810. spare tubes...is it worthwhile?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-04-26 13:42:28 UTC
From: ka7gkn
Topic: 810 Message: 810

is it worthwhile to purchase a set of spare tubes and have them sit in the closet? I do not see any urgency to do that, in fact I had an AL-80A in operation from 1989 through 2001 and never needed to change the tube. My concern is future availability or cost.

I will go on a limb here and say I estimate 765-1000 hours a year of use, [turned on] no way to calculate actual transmit time. my point is if the tube is rated at 10,000 hours of life keep in mind I run conservative not 1.5kw all the time...the math says a tube life easily of 10 years!

so if I buy a set of tubes and they sit for 10 years will they still be "new" or should I just not worry and save the 200 or so bucks for other ham goodies?

and finally tom's tubes sells a set for about 200 bucks ...are they matched or am I better off buying a set via Acom?

regards, Marty ka7gkn@...

Marty,

This is the same issue I have wrestled with. If you get a set of spares you would have to put them in the amp to see if they are ok or wait until you finally need them and find out then when the warranty is out and they are much older anyway. I understand that tubes that have been on the shelf for a long time need a special warm-up procedure done anyway. I suppose the best way would be to rotate them once a year or something. That is a bit of trouble but could be done. Is it worth it? I don't know. As long as the tubes are available at reasonable prices then I can't see it as a problem. I think delivery is likely pretty good on them. Then they are likely to be fresh warranty is good etc. If sometime down the road availability is a problem then we will wish we had spares.

I understand that Tom's tubes are matched and he supplies to some of the amp manufacturers such as Alpha. So he should be a good source. I am sure the ones from Acom are fine also.

Yes Spare tubes are worth while, and yes a procedure is needed if you are not sure of the Vacuum conditions or age of the tubes. On the Svetlana site this procedure is well documented on how to get the tubes set up and matched, especially new tubes. With the current price of $100.00 for two new tubes, from england, plus 18 dollars shipping this is cheap insurance.

815. Tube Temps

Yahoo group: acom-list (1999 — 2009)
Date: 2002-05-04 05:24:15 UTC
From: putt_1
Topic: 815 Message: 815

Hi Folks

Well, as of a couple of days ago, I'm a proud owner of a new 2000A. I just got it configured here in the shack and all I can say is WOW. It makes running an amp a joy rather than a loud blower, relay clicking experience that it has been in the past.

I do have one question on tube temperatures though. I was working a string of Europeans on 20m CW tonight and was running right around 900w. I noticed that my tube temperature was up around 70 deg C. Is this normal for the tube set in the amp? This is my first experience with the Russian tubes and I want to make sure that everything is fine. The tube temps at idle are in the 35 - 40 deg C range.

Your input would be appreciated.

Hi Greg,

It is normal to have around 70 deg C temp while operating continiuosly for couple of hours. Up to 100 deg C is normal and upper limit is 140deg I have been told. I usually have sometimes 90-100 deg when running pile ups in the contest.

73's and see you all from YM3LZ after few weeks in WPX CW.

Wally LZ2CJ&LZ8T & YM3LZ

Greg you'll love this amp! I have around 500+ hours of run time on mine. A few comments for you...first off if you experienced an odor comming from the amp not to worry it's just the new amp [car] smell and it takes a few hours to burn off.
do not forget to check the foam filter in the muffin fan on a regular basis it does collect dust.

think about using tissue paper to cover the chimney openings when not in use. This will reduce dust build up in the amp. When the amp is on the tissue paper is lifted out of the way by the blower air pressure. I have the tissue paper cut to cover the tube openings and then tapped to a piece of file folder paper on the side. this provides support for the paper and allows it to flip up when the amp runs.

operating temps at idle you'll experience between 30-40c and when you chat or whatever the temps can go as high as 100c with a typical temp around 70-90c. make a cheat sheet to convert to "F" and you'll realize these tubes like it hot! 40c=104, 70c=158, 100=212
the amp will alarm and shut the tubes down around 150c I think or at 303F...just be sure the amp blower is not blocked and you have good air circulation.

you should consider getting an ICE 330 120-0-120 in house power mains supressor noise and rf filter....think about this for a moment.... most likely you have surge protection on your computer and 120v ham gear, it's just common sense to do the same for your 220v linear and at the cost and electronics on this acom it should be a no brainer to do something ...the ICE 330 costs around 58 bucks and in fect it will protect your whole house. it fits inside your main breaker panel... call them 1-800-423-2666 eham.net has some info but right now ICE has no website that i'm aware of.

enjoy the amp and have lots of contacts....marty ka7gkn@...

From: Rune Wande
Topic: 819 Message: 819

Hi Greg!
I guess you will receive many answers!
Anyway, I have been
using my amp since December 1998.
The display shows three bars (roughly 30-35 degrees C)
idling temp and I seldom get a reading over 70 C while
running the amp. The reason for that is that I usually do not
run much over a kW. I understand that those running "full power"
get higher temperature readings and that is normal. It is not necessary to
buy the extra fan unless you run RTTY and such modes
with high power!
Your readings of the temperature seem quite normal.

Any NEWS about the Acom 1000 amp?
Any PRO or CON with unit?

How is it, using the LCD display?

On the wait list as of now.

To all that replied...thanks!

It looks like the temps are in the normal range and these tubes run a bit more hot compared to what I've had in the past. For those who asked, my amp came with the extra fan behind the transformer.

Thanks again!

William,

I used one last fall at V26B on 15 meters and it worked perfectly.

Very smooth operation and easy tune-up. Over 1000 watts out no problem.
The LCD is particularly nice and give you all kinds of operational data.

The real nice part was all you need to do is take it out of the box, put on
an AC plug, and turn it on - it's ready to operate as it comes in the box.
No assembly required.

I'm on the list too. I'm very anxious to try it out on 6 meters.

73,
Bob N5NJ

I have serial # 000001 here that I received at the beginning of last year.
It's been used extensively on 6M and has done a few HF contests. So far
absolutely no problems.

I find the LCD viewing angle a little tight, but not really a problem. Great
amp!

Bill,
You may also want to check the product reviews eham.net (direct link
http://www.eham.net/reviews/detail/1694). Looks like 100% glowing
reports (no pun intended) for the 1000.

For anyone visiting the Acom booth at DAYTON, please see if any info on the 2000A paint color is attainable.
Like the specific name or color...
I have a TINY that's T I N Y !!! scratch on my RCU and it's driving me nuts! [hey I'm a virgo] I have yet to pull the RCU and go to a model/craft store to match paint.
so it's not that big of a deal, however, if anyone knows where I can get a small bottle of the paint or a model paint name to match I'd appreciate it

regards, Marty ka7gkn@...

828. Acom2000A

Yahoo group: acom-list (1999 — 2009)
Date: 2002-05-28 10:52:29 UTC
From: iz5cml
Topic: 828 Message: 828

Hi, i'm writing for a good friend of mine
Massimo IZ5ASZ :

i have a problem with my new Acom2000A :

sometimes when change from a band to another the PA
goes in protection, on the display appears this error
message : " Band switch malfunction " and then the
amplifier turn off itself.

After about 5 minutes , i turn on again the PA and sometimes
start without problems, but most of the times after the count down
appears the same script : " Band switch malfunction ", and
turn off again.

I'm using a FT-1000MP Mark V and TH11DXs.

Any suggestion ??

Thanks and 73 de IZ5ASZ Massimo.

829. technical manual ?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-06-05 14:19:22 UTC
From: ka7gkn
Topic: 829 Message: 829

The other evening I was looking at my Acom 2000A documentation. The service manual, and exhibit-4 schematics, I also have the website internal photos. I stopped to wonder do I have all the documentation?

I recall last year when I ordered my amp I had difficulty with a font on the CD and could not open the thing up.

So...my querry to the 2000A group...

What does the complete technical manual look like -or- is that indeed just the 43 pages of schematics...If so, specific instructions like tube replacement, specific adjustments, are missing. I know when we need techy help Krassy responds in a timely manner with very good instructions...my concern is what happens after Krassy???? I'd rather have the back up of complete service/techy stuff on paper in a notebook just in case..
My user manual says "exhibit-7" the schematics say "exhibit-4"
what are exhibits 1,2,3,5,6???????
thanks,

Marty ka7gkn@...

p.s. one more question...anyone actually using the optional muffin fan???

I can answer your P.S. Yes I have the optional muffin fan. Don?t know if I need it. Don?t do RTTY. I cut up a high quality furnace filter into pieces that fit over the fan. This helps trap any dirt going into the amp. My amp is remoted in the basement. Usually it is on. I change the filter every 6 months ? it is black by then. But the inside of the amp is clean.

Marty,
I use the extra fan, as I do RTTY contesting.
Yes, access to the technical manual would be nice. Last time I inquired
(about 2 years ago) I was told it wasn't yet translated into English.

I wasn't aware of the fact that skematics needed translation.

I have wanted a full set for two years now. It might have saved one
trip back to ACOM.

Krassy was kind enough to try and send me selected skematics.
However, due to various I-net problems somewhere most of them never
made it here.

From: Brian, N8WRL
Topic: 829 Message: 833

I've gotten two 'technical CDROM's from ACOM, one from Krassy and one direct from Bulgaria. One of them has a 36 page .pdf file with fifteen different schematics in it - CPU, Exhause Air Temp Sensor, Motor position opto sensor, etc. There is even a schematic for a 'long' RCU cable. There are PCB board diagrams, etc.

I hope I'm not getting anyone into trouble here - I assumed they were readily available as I just asked for it. Odd that there are two different ones tho... The other looks more like advertising copy, images, etc. plus some formats I can't open (.P65?)

I wasn't aware of the fact that skematics needed translation.

I have wanted a full set for two years now. It might have saved one
trip back to ACOM.

Krassy was kind enough to try and send me selected skematics.
However, due to various I-net problems somewhere most of them never
made it here.

Maybe Krassy can be talked into having the manuals, instruction, schematics, etc on their web site? At least then we would have a common area for all of us.

Tony,

I have my 2000A remoted in the basement also. I love that arrangement! I was wondering how long your cable is to the RCU and is it a buffered cable. Mine is about 30 feet long. I made up a cable myself but Krassy says I should use their buffered cable. The problem is that I have had it on order for over a year and have not been able to get it. No problems with my cable though.

Anyone else remoting their 2000A over any distance?

I can answer your P.S. Yes I have the optional muffin fan. Don't know if I need it. Don't do RTTY. I cut up a high quality furnace filter into pieces that fit over the fan. This helps trap any dirt going into the amp. My amp is remoted in the basement. Usually it is on. I change the filter every 6 months - it is black by then. But the inside of the amp is clean.

I could easily put my Acom 2000A in the basement -- everything including 220VAC comes up from the basement to the shack through a couple of big holes in the floor. But the amp is so darned quiet I haven't taken the trouble to do it. It's on the floor under a table about 4 or 5 feet from the operating position. The blower is barely a whisper and I can't hear it with headphones on (my amp has the newer blower.) Besides, the blower in my 87A and intermitent fan in my FT-1000D dominate the ambient noise.

You are probably right. But Krassy thought it might be better to have it. So I ordered it about a year ago when I ordered the amp. Oh well... About six months ago he offered to send the money back for the cable but I said I would just wait and see if it comes. That way I will have it should any trouble come up. Well no trouble has come up and neither has the cable. Perhaps I will give him a call.

You are right Dick. It is quiet. I didn't have 220 in the shack and it is sort of warm up here at times so I thought the amp would be happier down where it is nice and cool. Besides, this way I didn't have to carry it up two flights of stairs.

840. Backup battery life?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-06-07 17:07:38 UTC
From: Brian, N8WRL
Topic: 840 Message: 840

Does anyone know how long the backup battery should last to remember tuning settings, etc? When I am going to be away for a while I'm in the habit of unplugging the amp even though it goes thru an ICE suppressor. I assume the backup battery take over then - any idea how long I can get away with this before having to replace the battery?

Thanks es 73!

-Brian n8wrl

Hi Brian, just a guess here. The battery is a lithium type...with a life of around 5 years. Since the battery has no charging circuit and since it's not a rechargeable type, I'd say the battery will last around 5 years +/- just like the lithium batteries in our other ham gear. So, if you unplug the amp and leave it sit 6 months I'd bet the battery will keep the memory, If you get a low battery display in the RCU then you need to replace it...I guess the better question is..during the replacement process will the memory be instantly lost? or do I have a few seconds to remove and install without damage or loss of memory?
Again the operating manual, see section 6-2, referes us to the technical supplement for specific details well....I still ask the question What technical supplement? all I have is schematics???

regards, Marty ka7gkn@...

Hi Marty!

Thanks for the info - that sounds very reasonable. As for whether there is time to change the battery before amnesia sets in, I haven't a clue. Either way, replacing a dead battery is a lot less expensive than replacing a fried amp so I think I'll keep it unplugged while I'm gone.

Thanks again!

843. UH-OH unit is shutting down by itself! HELP!!!

Yahoo group: acom-list (1999 — 2009)
Date: 2002-06-15 15:03:48 UTC
From: ka7gkn
Topic: 843 Message: 843

Hi gang ...I'm not sure what's going on. 615 run hours on the 2000A
and I was singing praises...yesterday as I was chatting on 14.178 the
amp shut off! well I then did the off for 5 min. ran through whatever
I could see on the rcu. all radio parameters and operating is as
always so nothing new.
I don't see anything obvious in the manual about "total power off"
Today I tried again...hoping for a self healing problem. it occured
again. I erased my user memory and redid it no change,
I do not have the "technical manual" that is refered to while trying
to figure out what's going on.

My 220 line is stable [240v actually], all cables good, tight, proper.

I am unable to attach the amp to my computer..to read the info box
data.
So...anyone out there have or having a similar experience please
contact me right away hopefully this will be an easy fix.

thanks... Marty ka7gkn@...

Marty, did a fault show on RCU? or when you say shut down do you mean it
just totally went off like you unplugged the power cord?

-Jim it just shut off...it went from lit rcu showing the normal temp
and freq etc. when I keyed the mic to talk it went off the amp shut
down to the acom logo display standby/off mode. The box main switch
is still lit on and that's all, no error or fault indications what so
ever. I ran it again and looked at what static/non tranmitted
parameters I can see in the measure mode and all looked ok....
start temps about 31c, screenv=10v, mains 238, if- front/rear=3.6a
both, hv=2.67kv, fil-12.5,
615 hours, software ver 4.5 I did not transmit to read other
parameters since their values change as drive power changes.

all connectors are secure and proper. no coax or other problems,
nothing new to rf system since I set up the amp.

When I key the mic or key down a tone I send 20-25 watts to the amp
so I'm no where near over driving the thing!

right now I have that emotional knot in my gut totally bewildered to
what's happening and what do I need to do to fix it. I sent krassy a
note and likely first thing Monday I'll call Acom!
I sure hope it will be a known failure...and something I can
accomplish here SAFELY and quickly...I'm intimidated by HV!!!!
regards, Jim and any other input from you will be appreciated.

oh,oh no lightning or emi strikes near here only 108-110 degree and
10-13% humidity...

I've suffered the amp doing this when the mains drop out for a
fraction of a second. By the time you figure out what happened, you
end up waiting the entire delay time during restart.

Perhaps this isn't your problem. However, it is a pain-- especially
during contests with earphones on (you don't know it dropped out).
This kind of problem for the computer was solved by a UPS. Imagine
the UPS required for the ACOM!

There needs to be some kind mod made so that the amp rides out
momentary power line drop outs-- in my opinion. I don't know how
DXpeditions and those with poor power line reliability live with this.

Marty, wow! mine is 4.5 version also. Comparable hours to yours. Never has shut off. Had an ARC fault a couple of times but found it to be a coax jumper problem. My readings about the same as yours 31c,screenv=10v,mains 241v, if-front/rear=3.6a, hv=2.68kv, fil=12.5v.....notice you did not include Bias, mine is -122v.

Are you saying it can just shut off while not transmitting any power????? When the RCU goes off can you just turn it back on? If so, do you have to wait your 2 1/2 minutes warm-up again?

Seems like I remember something about a battery inside the RCU but I think this is menu memory function only.

As you mentioned I guess the best to do is call Krassy on Monday. Beside that and I know it's a pain but I would unplug the amp, take the covers off and check all connections and fuses in the amp.....2nd thought probably only if Krassy has no idea what to do and requests you return it, then I would check for loose connections.

Good Luck.

73 de KE4WY Jim

Sorry Jim, I neglected to add the bias voltage it's -124. After a few hours I tried again and now it just plain shuts down after the 2 1/2 minute warm up ..the display shows 000 sec the servos start and just as the "R" is sent in cw the thing goes "click" and off to the point where the "ACOM 2000A" logo appears on the rcu....Someplace in this reflector I read about a transistor failure on the interface board..does that sound familiar?
I had an arc fault in the early days of the amp. It turned out the amp did not like the timewave anc-4 in the rf line. the relay is too slow! so I inserted the anc-4 in the receive line via the insert in the 1c-775dsp..works great and no more arc fault alarms.
I plan to be on the icom user's net this morning 14.315 @ 1700utc

regards, Marty

Hi Brian, thanks for your comments. As you read my measured settings and yes the bias is -124 and you compare them to Jim's another message, you'll see all seems normal. I have basically stable power comming into the shack. the 220 run is less than 20 feet to the shack's outlet. I truely doubt it's a supply voltage problem. By the way, I have installed the ICE 120-0-120 mains surge/impulse supressor noise and rfi filter model 330 $58.00 [I think] in my circuit breaker panel.
I recall someone else having a similar problem I think, and it turned out to be a transistor failure on the interface board.
since everything lights up, I have high voltage and it does the 2 1/2 minute warm up. I doubt I have any power supply problem...if one did exisit I'd see a blown fuse or no hv or lv or the filimant voltage etc.
When I transmit 20-25watts drive key down in rtty on the ic775dsp the thing shuts down or if I speak, and yesterday as soon as the letter "R" was starting to do it's cw thing the first dit the amp shut down!
I'll call acom fisrt thing monday and of course I'll shae the information with the group

marty ka7gkn@...

Marty,

Speculating from across the USA probably won't help you, but clearly the bad component is getting worse! It's certainly possible that a transitor or IC is giving up the ghost, though failure mode with such devices tends to be black and white -- good or bad. It's also odd that a flakey semiconductor would fail only on transmit for a while, then get worse and fail after the warmup period.

As crazy as it sounds, I wouldn't rule out a tube problem. Although the ACOM is *far* superior to the Alpha 87A in detecting tube problems, the nature of the beast is such that it's difficult to write software that can accurately diagnose a tube fault in 100% of the failure modes.

I had a problem like that on the 87A that nearly drove me nuts. It started with all kinds of odd "soft" faults -- bad PIN diode voltages, mostly, suggesting bad PIN diodes. Then I started getting "hard" faults (power shutdowns.) Unlike the ACOM, the 87A reports those when you restart. There were several fault codes, including PIN diode voltages, HV power supply, low voltage power supply, etc. The problem went from being intermittent to shutting down the amp after the warmup period. Finally, it shut down the amp every time I hit the On switch.

I figured it was a power supply problem, so I took the amp apart, pulled the power supply boards and tested every component. Nothing wrong. I even fed them power from sources other than the main transformer and the output voltages were fine. When I put the amp back together, the problem was worse -- it was blowing a 1A fuse in the step-start circuit and little tendrils of smoke were emanating from the area of the power supply boards! I think it blew the main 20A fuses once or twice, too.

Finally, I got the bright idea of testing the amp without the tubes. Lo and behold, it came up immediately after the warmup delay! I tried bringing up the amp with each tube in turn, and discovered that one of them was causing the problem. Replacing that tube fixed the problem.

As it turns out, about a year earlier I had gotten some "Bad Cathode Current" faults and replaced one of the tubes. I got a few HV arc "thump" faults with the new tube, but the manual says that's normal for a new 3CX800. Gradually, the thumps became more frequent, but not enough to arouse suspicion. Then all the wierd faults started. [By the way, I went back to that tube and have not had any

faults for over a year -- the original problem was probably caused by a bad contact between pin and socket, caused when I removed and reinstalled the tube while troubleshooting a bad PIN diode several months earlier (that really was a bad PIN diode.) Eimac replaced the bad tube under warranty, thanks to Alpha. Some sweet-talking was necessary because the bad tube rolled off a table as I was packing it and bent the cooling fins! I swore in writing that the tube was bad before that and Alpha sweet-talked Eimac.]

I suspect that the bad tube was gassy from the start. The thumps were caused by HV arcs when the gas would build up enough. Eventually, enough gas built up that the tube was arcing as soon as any power was drawn. Gas continued to build up and eventually the tube would arc when full HV was applied after warmup. Not too long after that, even the lower HV used during warmup caused arcs and the amp would shutdown immediately. As the problem worsened, the arcs got faster and stronger -- eventually to the point of blowing fuses.

The point of my story is that as the problem got worse, the fault reports got more and more misleading -- to the point of no reports and blown fuses. The problem is that the 87A software is single-threaded, not interrupt-driven. It goes through a main loop of code looking at each sensor to determined if there is a fault. HV arcs pull so much power that they can cause voltages to drop all over the amp, in turn causing virtually every sensor to report abnormal conditions. In fact, the sensor circuits themselves can be affected by power fluctuations. When multiple sensors report bad parameters, the code simply picks the one it happens to be checking.

I found this out back when I had a TS950SDX with nasty leading-edge power spikes (up to 250W!) that would instantaneously overdrive the 87A. You would think it would be reported as an overdrive fault, but it always got reported as abnormal gain (high input, low output.) That's because the code checks the gain just before it checks the input drive level. It's just a matter of the order of the checks.

It's possible to minimize fault detection timing problems by using an interrupt-driven I/O design. In this scheme, the sensor circuits cause interrupts (like IRQs on your PC) asynchronously to whatever else the software is doing. The CPU stops what it's doing and examines the cause of the interrupt. Even then, if a massive voltage drop caused multiple circuits to report abnormal conditions at the same time, the CPU still has to step through the sources of the multiple interrupts one at a time and that could cause erroneous fault codes or actions. In my case, the arc faults got so bad that too much power was being pulled even before the step-start delay finished -- too fast for the CPU to get out of standby and detect it, regardless of the fault detection design.

I think Krassy or someone at the factory told me the 2000A is interrupt-driven. It's more expensive to do that in the hardware, so

I'm a little skeptical. It is true, however, that the 2000A fault detection is vastly superior to the 87A.

If a tube fault is indeed the culprit, then I would suspect that the 2000A considers a certain voltage or current fault to be so bad that it shuts down the amp immediately, without reporting a fault. Another possibility is that there's some sort of analog detection circuit designed to shut off the amp in the event of radical power supply behavior -- i.e., the CPU isn't even involved. That's not necessarily bad -- tube arcs can cause massive damage, especially to the plate choke and HV supply.

I have a feeling that the 2000A won't be happy running with no tubes or only one. Its fault detection is pretty picky. Also, I don't know if it would be bad for a pentode circuit to run without one or both tubes (no problem doing that in the triode-based 87A.) If you can get your hands on one or two spare tubes, I would swap them for the old ones. The tube replacement procedure requires adjusting the idle current, but I would imagine that you could get by without doing that for a quick operational check. If the amp comes up after swapping tubes, you should probably do the adjustments before transmitting.

Sorry for the long story, and I realize I could be totally wrong here -- could indeed be a semiconductor. I don't think it would be harmful to try a tube test if you can and you might get lucky.

73, Dick WC1M

Thank you dick, very much for your detailed message. since the amp is under warranty I will first call Acom first thing Monday and see what they say...I'll definitly share the comments on this reflector for all ....I will ask about the tube or tubes going bad.it's a possibility.

I hope though I won't have to ship the thing back, however if that's what it will take I'll do it...

regards Marty ka7gkn@...

Mine kept shutting down, and it got worse and worse. A quick trip to Krassy
(he's about 1 1/2 hours drive away) and it was in fact bad tubes. Krassy
replaced them and the ACOM is happy as a clam :)

Thank you Ted for your comments...It's Monday about 5:45 a.m. and Krassy is on the phone with me!!! WOW! what a guy!...We ran some quick tests and your scenario sounds similarto to what's going on here.
The end result? My amp will get to go on vacation and take a trip to Mass. While I stay here in the 106++ warm weather [14% humidity] and run qrp [200w ic-775dsp] ha ha!!!
Because of the time to ship I figure 2 weeks at a minimum...But that's ok

regards, and I'll post the results of the repairs when the am returns

854. 2000A failure update

Yahoo group: acom-list (1999 — 2009)
Date: 2002-06-17 20:31:54 UTC
From: ka7gkn
Topic: 854 Message: 854

Thanks to those of you in this group to respond with possible solutions. Krassy contacted me first thing this morning and we went through some steps...alas no self healing solution, well....so much for being a Rabbi's son with the magic touch!...
I shipped the amp back to ACOM and they will take care of it.
via arm chair/telephone troubleshooting the most likley cause of the immediate shut down without error code is: the possibility of a fast arc shut down due to bad coax or connectors to where the error code would not appear on the RCU.
To eliminate the possibility of a bad coax. I hooked the amp directly to a dummy load and bypassed all the doodads in the rf line like meters and lightning protection etc. I reset the user settings and again poof above 10 watts drive immediate shut down.

The next logical step was then the possibility of a defective tube. This is where we stopped and I packed up the amp.

A word of advice to all you ACOM users. Use the best quality PL259 connectors and other UHF adaptors like the 90 degree ones you can get!!!! Also use the highest quality coax no radio shack stuff!!! use 9913 flexi or LMR400, or RG213 or 214 types....remember we are talking 1500Watts lots-o-power here and cheap poorly made coax will break down and cause problems. Also avoid sharp bends nice smooth curves. Oh yeah and do a good job soldering those connectors!

I'll keep you all informed as to what was done with the amp when I get it back. I estimate no more than 2 weeks

regards, Marty ka7gkn

855. 2000A repair update

Yahoo group: acom-list (1999 — 2009)
Date: 2002-06-21 14:00:53 UTC
From: ka7gkn
Topic: 855 Message: 855

WOW! I am amazed at the service...with that said,
I shipped my amp to Acom via fed-X 3 day $$$$$ plus insurance but
that's ok...the box is heavy, Oh, I did not send the transformer so
that saved some..

ok,ok, the amp was supposed to arrive no later than thursday 4:30,
Stay with me folks....
I get a call Thursday afternoon, We have a 3 hour time difference
anyway, Krassy gets on the line and says "your amp is fixed"!!!!
At first I still wondered if something here in the shack, bad coax,
etc caused the failure...well it was a real malfunction, something
that might be difficult to determine without experience inside the
box.

The failure was the low voltage board! one voltage was gone and
that's why no failure codes appeared on the RCU...anyway, the end
result...is they replaced the board and the amp should be back here
mid next week...

I am very satisfied with the speed of repair...
Thank you to the guys and gals at ACOM

I'll report more when the amp is reinstalled....

Marty ka7gkn@...

856. My 2000A is home!

From: ka7gkn
Topic: 856 Message: 856

The amp arrived June 28th so with respect to other company service ACOM's is amazing!
I reinstalled the amp and the only complaint are all those tiny metric screws and the soft material they are made of...very easy to strip take it from me don't overtorque!!!! just snug or you'll have trouble!!!! I messed up a nut and had to install a 6-32 thread insert rivit style.

Tell me, the reason for the many screws is to keep the cover tight and ensure rf does not leak out? or is the intent to keep little hands from opening it up ?????

well another happy ACOM user....

regards, Marty ka7gkn@...

> regards, Marty ka7gkn@a...

I already have about 10 hours of run time on my 2000A. The amp is working perfectly. I have noted when the amp when in for repair I had 615 hours of run time, and with the repair the clock has been reset to zero. I may have even done that resetting the amp when troubleshooting. So I just noted in my log the 615 hours and life is good!
I'll be going to a local screw source [outta of the gutter guys!] and see if I can locate some black anodized metric screws. I will let you know if I do and I'll have extras for anyone too embarrassed to ask Krassy for some because they over torqued!!!!

regards to all...Marty ka7gkn@...

858. Acom 1000 and Icom 746

Yahoo group: acom-list (1999 — 2009)
Date: 2002-07-02 12:26:11 UTC
From: Irwin C Darack
Topic: 858 Message: 858

I recently purchased an Acom 1000 and I'm in the process of connecting to my Icom 746. The keying circuit that Acom send me, a diode and a capacitor across the Send jack does not seem to work. Using a reed relay across the send jack will disable the QSK feature. Here are my questions:

1) Acom feels that I can directly connect the amp to my rig with no problem. I measured 12 V and 11 miliamps from the Key in RCA plug on the amp. Icom manual states that the rig will handle 16 V up to 2 amps. Will this connection work and any comments here?

2) Acom has also recommended trying the Ameritron keying circuit connected to the RCA jacks?

3) What other types of connections have people used?

It seems to be a great amp, very low noise and good power.

Thanks for your help.

Irwin KD3TB

Hi Irwin,

That's Wally LZ2CJ(LZ8T & YM3LZ).
I have an IC 746 and ACOM 2000A. Direct connection of the rig with amp is working just fine. Since ACOM 1000 Send Jack should be the same as for 2000A as far as I know, there should be no problems to use your IC 746 with your ACOM 1000.
Just connect two Send jacks of trcvr and amp and everything should go fine for you. You will not even have spikes I am experiencing sometimes because this problem has been fully solved with 1000 model. (although spikes are ICOM radios problem not ACOM's one !!!)

Happy "amplifiering" there :-))))).

73's de Wally

Iriwn,
I'm not familiar with Icom keying circuits, but my Yaesu directly keys my 2000A, using the transistor switch in the radio. The internal relay (in the radio) is not necessary, and is disabled to keep the noise down. Does Icom use some funky keying circuitry that makes it different?

Hello Irwin,

I use an ACOM 1000 (s/n C10061) with an Icom IC-746. I've experienced problems with this interface. But ,with the great help of Stan, LZ1IU, at the ACOM factory, I 've been able to solve the problems. I'll try to explain the problems I've had, and also explain the purpose of the capacitor and diode, which ACOM is suggesting that you use.

For amplifier keying, the IC-746 offers an electromechanical relay (hard contact) at the SEND jack, plus a solid-state relay (transistor) at HSEND (pin 3 of ACC-1 or ACC-2). The electromechanical relay (SEND) can switch up to 2 amps (at 16V dc), but is relatively slow for keying the amp. The solid-state relay (HSEND) can switch only 20 milliamps max., but offers fast keying of the amp. The ACOM T/R circuit draws less than 20 milliamps, so both the SEND and HSEND keying outputs from the IC-746 are compatible with the ACOM (KEY IN).

The ACOM amp is designed to sense "hot switching". That's the condition where RF from the exciter reaches the amplifier, before the amplifier's T/R circuit has fully switched to transmit mode. The ACOM's fault detection circuitry protects the amp from hot switching, and displays the fault message. It makes sense, then, to use the faster HSEND keying output of the IC-746 to minimize the possiblity of hot switching the amp, when the PTT is engaged (key down). Also, using the faster HSEND is always preferred over using the SEND output, whenever QSK is used.

In the case of my IC-746 (and I suspect many others), there's an additional problem. The IC-746 produces an RF pulse of about 4 milliseconds duration about 2 milliseconds after the PPT of the IC-746 is released. This condition is sensed by the ACOM as hot switching, upon release of the PTT (key up). To solve this problem, the slower (electromechanical relay) SEND keying line of the IC-746 is used in addition to the faster (transistor) HSEND keying circuit.

This is where the diodes and capacitors come into play. The two keying lines are isolated from each other, using two diodes (IN4001, or similar). Connect the anode of both diodes to KEY IN of the ACOM. Connect the cathode of one diode to HSEND and the cathode of the other diode to SEND of the IC-746. Connect a capacitor (.0047 to .001 microfarad @ 50V) in parallel across each diode. A small box with perf board and RCA connectors from Radio Shack made this a fast and easy project.

In review, the use of the faster HSEND keying output from the IC-746 prevents hot switching upon transmit. While, use of the slower to release SEND keying output of the IC-746 prevents hot switching, due to the inherent rf spike produced by the IC-746 upon release of the PTT. This approach,

which was suggested by Stan, LZ1IU, has solved my IC-746 to ACOM 1000 interface problems.

My suggestion to you is to try a direct interface, using HSEND (DIN plug on the ICOM end, and RCA plug on the ACOM end). Note that the KEY OUT connector of the ACOM 1000 goes unused (ICOM does not provide an input for this "ready to send" signal, as some other radios do). If you experience hot switching problems with this approach, then consider the solution I've outlined, above. I'm sure that you'll find that your IC-746 and ACOM 1000 will live happily, together.

A final note: ACOM may have made some changes to their current 1000A model, which makes the amp more forgiving to these IC-746 keying issues. However, I'm only guessing.

Vy 73,
Bob, W?BV

Robert,

Thanks for this excellent review and assistance. You have given me a great sense of where to begin and some work to do over our holiday weekend.

Much appreciated, Irwin KD3TB

863. 3mm metric cover screws...be careful with them

Yahoo group: acom-list (1999 — 2009)

Well fellow 2000A users let me warn you of a potential frustrating problem...WAIT DON"T PANIC!!!! the amp is great! I'm discussing the hardware!!!!
the cover uses 29 black anodized 3mm metric screws with washer type heads!!! They are very soft, they can and will strip easily if you are not very careful. Use the "proper" phillips screwdriver...a metric phillips head is ideal but many won't have that so go with a #1 phillips head!
The hex nuts are pressed into the chassis and will "fall out" if you force any of the screws. DO NOT USE A POWER DRIVER!!! I was using mine a milwaukee power driver set to the minimum torque. This is still too much. The cover is well made, You'll notice the holes are slightly larger than the chassis to allow some room to wiggle.
I suggest you insert all screws leave them all loose to ensure you can get them all in, then go back and "snug" them down. no extra twisting or you'll be sorry!!!!

I have 3 nuts than fell into the amp and no where in Phoenix Metro does anyone know what a 3mm metric cinch type nut is!!!! and once used you can not reseat them!!! Super glue does not workkkkkkkk uh oh super glue on the k key ha ha

I ended up going with tinnerman nuts for two and was lucky to have room to fit. the other one required me to enlarge the hole and inset a 6-32 threaded rivet. It was close but works. Too bad they don't make these things in 4-40 that would be perfect.

I did locate a source for the 3mm screw but not in black so I bought a bunch and painted 25 of them black and then tossed the original ones. the new ones seemed to be easier to get started.
So, it's now a secret between you and me....I have 2 black tiny sheet metal screws ..one on top one on a side using tinnerman nuts and one on top using a black 6-32 screw.

in summary:
the 28 screws for the cover are soft, delicate, 3mm metric, non-forgiving, the cinch nuts pressed into the chassis will fall [drop] if you force the screw, or push too hard. The nuts can not be reused! so use the correct phillips head driver, do not use a power driver, do each one lossely until all are in then go back and gently sung them down.

Regards, Marty ka7gkn@...

in their efforts to make rf tight enclosures they appear to have joined
Ameritron with the "what do you mean there are still another 15 screws to
put the cover on" category!

mebbe someone will invent a metal Velcro - brillo meets steel wool?

Kepp the faith

Hi Marty,

I hope there is some solution for the detached hex nuts press fit in
to the chassis.

I have two here which have detached. I wonder if some of that liquid
metal will work? Trouble is they are in pretty awkward places.

Is there a factory solution?

Well Brian kind of a relief to know I'm not alone in the clinch nut dropping out! yep "clinch nut" the official name they are designed to be pressed in/on the chassis with a press. so, just squeezing won't do it nor using the screw to snug it back into place. I suspect when they drop they can not be reused. I'm not sure about using any of the epoxy type adhesives it could get messy in there.

I'll keep looking for an after market solution. By the way, check out your local hobby store they are a great source for small sae and metric hardware, tools and even a 3mm tap and die!
I have contacted a few fastener places but they do not sell to us low-lifes only to manufacturers ha ha

I'll keep the group posted to any solution.

Hi,

I have keyed my Acom 1000 directly from the Icom 746 with no
problems. I just used a cable with phono/RCA connectors on
each end, going tome the Icom SEND jack to the Acom KEY IN
jack.

Some very useful information, Ed --
By the way, I arrived home with only some relatively minor problems
in Toronto and Chicago (almost missed the plane in Toronto and had
to stand in line for an hour in Chicago because they sent my baggage
to the wrong airport).

73, Arliss

Hello Irwin,

I use an ACOM 1000 (s/n C10061) with an Icom IC-746. I've experienced problems with this interface. But ,with the great help of Stan, LZ1IU, at the ACOM factory, I 've been able to solve the problems. I'll try to explain the problems I've had, and also explain the purpose of the capacitor and diode, which ACOM is suggesting that you use.

For amplifier keying, the IC-746 offers an electromechanical relay (hard contact) at the SEND jack, plus a solid-state relay (transistor) at HSEND (pin 3 of ACC-1 or ACC-2). The electromechanical relay (SEND) can switch up to 2 amps (at 16V dc), but is relatively slow for keying the amp. The solid-state relay (HSEND) can switch only 20 milliamps max., but offers fast keying of the amp. The ACOM T/R circuit draws less than 20 milliamps, so both the SEND and HSEND keying outputs from the IC-746 are compatible with the ACOM (KEY IN).

The ACOM amp is designed to sense "hot switching". That's the condition where RF from the exciter reaches the amplifier, before the amplifier's T/R circuit has fully switched to transmit mode. The ACOM's fault detection circuitry protects the amp from hot switching, and displays the fault message. It makes sense, then, to use the faster HSEND keying output of the IC-746 to minimize the possiblity of hot switching the amp, when the PTT is engaged (key down). Also, using the faster HSEND is always preferred over using the SEND output, whenever QSK is used.

In the case of my IC-746 (and I suspect many others), there's an additional problem. The IC-746 produces an RF pulse of about 4 milliseconds duration about 2 milliseconds after the PPT of the IC-746 is released. This condition is sensed by the ACOM as hot switching, upon release of the PTT (key up). To solve this problem, the slower (electromechanical relay) SEND keying line of the IC-746 is used in addition to the faster (transistor) HSEND keying circuit.

This is where the diodes and capacitors come into play. The two keying lines are isolated from each other, using two diodes (IN4001, or similar). Connect the anode of both diodes to KEY IN of the ACOM. Connect the cathode of one diode to HSEND and the cathode of the other diode to SEND of the IC-746. Connect a capacitor (.0047 to .001 microfarad @ 50V) in parallel

across each diode. A small box with perf board and RCA connectors from Radio Shack made this a fast and easy project.

In review, the use of the faster HSEND keying output from the IC-746 prevents hot switching upon transmit. While, use of the slower to release SEND keying output of the IC-746 prevents hot switching, due to the inherent rf spike produced by the IC-746 upon release of the PTT. This approach, which was suggested by Stan, LZ1IU, has solved my IC-746 to ACOM 1000 interface problems.

My suggestion to you is to try a direct interface, using HSEND (DIN plug on the ICOM end, and RCA plug on the ACOM end). Note that the KEY OUT connector of the ACOM 1000 goes unused (ICOM does not provide an input for this "ready to send" signal, as some other radios do). If you experience hot switching problems with this approach, then consider the solution I've outlined, above. I'm sure that you'll find that your IC-746 and ACOM 1000 will live happily, together.

A final note: ACOM may have made some changes to their current 1000A model, which makes the amp more forgiving to these IC-746 keying issues. However, I'm only guessing.

Vy 73,
Bob, W?BV

From: Irwin C Darack
Topic: 858 Message: 869

Robert,

Thanks, the amp is on the air. Your suggestions and the wiring diagram I received from Acom worked. I did try just the RCA connection, but the amp would give me a "hot switch" fault.
.

Regards, Irwin KD3TB

870. Won't turn off

Yahoo group: acom-list (1999 — 2009)
Date: 2002-07-28 17:15:30 UTC
From: Dave Hawes
Topic: 870 Message: 870

My 2000A has developed a "problem": it won't turn off properly.

When I press the red ON/OFF button, the display shows the normal cooling down message, but then instead of doing a normal shutdown, it does everything right, except:

1. The display backlight remains on, and
2. The amber "STB" LED remains illuminated.

The amplifier is indeed off, and if turned on, performs in the normal way. Cycling neither the mains nor the power switch on the amplifier unit itself has an effect on this symptom.

Has anybody seen this?

Dave N3RD

Dave,
Chances are that you have already received a reply from Will or Krassy. I had a problem although different is similiar enough to your own. I received an answer in less than an hour from Will and a phone call shortly thereafter...that's service!
The problem I had was determined to be in the control unit. Continuity and voltages measurements were made on the cable and the unit to reach this conclusion. The cause turned out to be oxidation on the cable and/or socket contacts within the control unit. Some alcohol and a Q-tip solved it. If you would like the values and more detail feel free to contact me although I am confident Will will be adressing your specific problem shortly.

Good Luck,

Howard...K2HK

872. Xmit during warmup bad?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-08-08 23:05:03 UTC
From: Brian, N8WRL
Topic: 872 Message: 872

Hi all!

List has been a bit quiet lately, so I thought I'd toss in an experience I just had. TY9F is on for his last night so this was my last chance to snag him on 20m phone. As I usually do, I turned on the amp and tried a few times while it warmed up. I'm guessing my timing was bad because just as it rounded 000 seconds for the warmup and the motors whirred, I made a call and the amp faulted with a 'bias too low at power on: -000V'. After a moment it went back to the 'turned off RCU' state and I turned it on again. It repeated the whole warmup time and I stayed off the air. This time all is well (and I got the TY) but I wonder if anyone has seen this before?

Hopefully it doesn't happen again - first problem in close to two years...

73!

-Brian n8wrl

873. Problem persists!

Yahoo group: acom-list (1999 — 2009)
Date: 2002-08-09 00:27:36 UTC
From: Brian, N8WRL
Topic: 873 Message: 873

Hi all!

Well, the amp is down. :(Here's a chronology this evening (8/8/02):

7pm

Warming up the amp while calling on 20m phone. As soon as the tubes are warm, I'm pretty sure I transmitted and the amp faulted with 'BIAS TOO LOW AT POWER ON: -000V'. After a moment it went back to the 'RCU off mode'. I waited a minute and pressed the red ON/OFF button and the tubes started warming up again. When the finished, the amp bahaved normally.

7:45pm

No transmissions for at least 15 minutes while the amp was on but idle. Another fault: 'BIAS VOLTAGE TOO LOW: -070V'. I tightened all the RCA plugs for my TX-IN/OUT loop while I waited a few minutes with the amp off. Again I pressed the red ON/OFF button and the tubes warmed up normally.

8pm

After completing a short QSO on 40m CW the RCU went dead! No lights, no message, nothing. Even the red LED on the unit itself is off! The breaker is good and there is 220V at the wall. I run the amp power thru an ICE338 220V surge suppressor which has two 250V/30A fuses - one for each 110V 'side'. One of them is blown!

I plugged the amp directly into the wall and after warming up I got the 'BIAS TOO LOW AT POWER ON: -000V' fault again. It is now off.

So now I'm worried about _why_ just one of the fuses would blow? I guess it could be as simple as a fuse wearing out (?). Would the faults cause more current to be pulled on half the 220V?

Any ideas?

Thanks!

-Brian n8wrl

S/N 0201XX arrived today. Shipped right after Will got the check. Following directions, on air in 15 minutes. Plays very nicely with FT-990 and F12 5BA. Getting excellent reports. All prior kudos apply here also. Hear it on the Maritime Mobile Net, 14.300, Sundays 2100-2200 UTC when I'm NCS. FB to join this group.

Hi Brian,
I've had a similar trouble last March .... it should be a tube failure , one of the 2 tubes are short cirtuiting ..... sometimes it appens that all goes OK , but probably you're going to have a full failure in few days ..... try to contact ACOM and ask them how to test the tubes .... i found a tube that sort circuit after 40/60 secs of warm up .

Will is very diligent in responding to problem reports. A few weeks ago, I posted to this list a message that my 2000A "Won't turn off." Will responded with some detailed troubleshooting instructions. Fortunately, the problem resolved itself. While puttering with the problem, I randomly pressed the Enter button during a normal warm up sequence, and the amp shutdown normally. From that point on, the shutdown sequence has been executed properly.

It is reassuring to know that the Customer Service Department is manned and responsive!

Hi all,
Running Ampmate for the rist time on my WinXP system. Ctonrols the
freq OK, however, the real-time power display seems to have a mind of
its own, and is not following the power meter on the RCU in real time.
Soemtimes, takes 4-5 secs to come back down to 0 after the xmitting
has actually stopped. Anyone else running it on XP and/or seen this?
Tnx,
Barry W2UP

From: K4HW
Topic: 878 Message: 881

I haven't heard of Ampmate either but I have heard of XP. Seems that it has a lot of compatibility issues. Here is a clip from a web site. Let us know if it helps.

73 Hal, K4HW

Running Programs Under Windows XP

Windows XP is not compatible with many applications as it comes out of the box. If you have difficulty running any programs, you may need to set Windows XP compatibility to Windows 98.

Follow the steps below:

a.. Go to Start
b.. Select Help and support
c.. Select Application and software problems
d.. Select Fix a problem
e.. Select Getting older programs to work under XP
f.. Select Program Compatibility Wizard

Subject: [acom-list] Ampmate software problem

Hi all,
Running Ampmate for the rist time on my WinXP system. Ctonrols the
freq OK, however, the real-time power display seems to have a mind of
its own, and is not following the power meter on the RCU in real time.
Soemtimes, takes 4-5 secs to come back down to 0 after the xmitting
has actually stopped. Anyone else running it on XP and/or seen this?
Tnx,
Barry W2UP

Hallo,

I'm looking to buy a second hand FT-1000MP tommorow, but like to
check out two things already :

1) What is the best way to interface the Acom 1000 amplifier ?
2) Does the FT-1000MP cat's interface hooks up directly to the RS232
of my computer or do I still need a CAT interface ? If so, any
webpages with interfaces that works ?

Extra : all tips, info, etc... welome, I new to this rig.

885. Acom 1000 problems - drops power

Yahoo group: acom-list (1999 — 2009)
Date: 2002-09-30 04:04:26 UTC
From: Phil ON4VP
Topic: 885 Message: 885

Hi all,

I've been using my Acom for about 9 months now.
It looks like I will be one on the first having problems.

A few weeks ago my Acom started to run very hot (after a few minutes of ragchew to more than 90° celsius).
The blower kicks in hard and I felt very scared about the way the Acom behaved.

I checked power output and other readings finding out that :

1) power is now max 600 watt instead of 1100
2) Screen current idle is 120mA instead of 50mA (normal)
3) Screen current is 470 mA instead of 320mA (normal)

I called my dealer and he contacted Acom in Sofia Bulgaria.
They made me run some tests and I mailed them the results.

Acom's engineers came to two possible solutions :

1) bias regulater is damaged or broken
2) tube could be the problem

I'll take my Acom to the shop next week for repair under waranty.
I'll get back to this listr with more news.

Hi!

I have almost the same problem (if it's a problem)
with my ACOM-1000. I got this almost year ago.
After about 2-3 minutes of chat (or RTTY activity)
tube temperature grows up about + 70-80 Degrees C.
Sometimes = +90c and even +95c.
I think this is a normal temperature value.
GU-74b tube can take more then +150c.
Don't worry. Just try cleanning TUBE orrange rubber holder.
If will be remoove this stuff, be carefull!

From: N1EU
Topic: 887 Message: 888

I just found out from Acom that in early 2000 a dampened mounting of the relay was incorporated into 2000A production units and earlier units cannot be retrofitted. As far as I know, it made the 2000A quieter in QSK, but made no functional difference.

Hi --

I saw a few tantalizing messages about Acom Tools and WriteLog. Can someone explain what this is all about?

I am running a SO2R station with two Acom-2000 amps and WriteLog. The hints from the website seem to suggest that I can remove
the Acom RCU from the desktop during the contest and put the key data on my computer screens? And get WriteLog to change bands on
the Acom without having to send RF into the unit first? If so, how can I set this up?

Thanks.

Topic: 889 Message: 892

Eric,

FYI this code was two years after promised and getting any kind of support seems to be impossible.

The designer did not overcome the major problems with the antenna switching where one has several antennas per band. It would have been nice to have the software (via keyboard selection of appropriate antenna) follow the selection and have the proper settings. The amp has a major shortcoming in this regard. We really needed some kind of analog input to the amp to permit this as well as an interface to the standard BCD antenna switching hardware.

The whole idea of communicating over an oddball designed network is bankrupt. I have the network commands and believe me they are like nothing else in existance. I played around with them for a bit before concluding that the amp doesn't respond as they say. Gave up on the project. I suspect that explains why it was two years late.

These are my private opinions and please don't quote me on it.

Eric,

"These are my private opinions and please don't quote me on it.

73 de Brian/K3KO"

Interesting, since you shared your opinion with the entire reflector!

I was the original author of the software, as you know. Michael Elfial, in Bulgaria, a non-ham, took it over, and re-wrote his own design from my original code. He no longer has a business relationship with Krassy. So, the software is somewhat in limbo.

Yes, I agree, there are some very bad design decisions in the Acom control protocol. It's a great amp, but very hard to work with as far as antenna control.

894. Advice on A1000

Yahoo group: acom-list (1999 — 2009)
Date: 2002-11-04 21:42:57 UTC
From: w4fms
Topic: 894 Message: 894

Hi All:

I'm considering purchasing an A1000 for cw contest use. I want to run the amp at 1KW and want nice and quiet qsk switching. Based on the eham reviews, seems like the A1000 would be a good choice for this kind of duty? I would be interested in hearing from others using the amp this way.

Secondly, in the manual it states that a qualified technican should replace the 4CX800. I'm wondering what is the issue here and why is it difficult to replace the tube?

Any input appreciated.

Frank, W4FMS

Hi Frank!

I have an 2000A and regularly run it at 1.5kW on CW. It is veeery quiet and cool. If the 1000 is anywhere near as quiet you'll be pleased.

I had to replace the tubes in my 2000A and I see from a photo of the interior of the 1000 that the arrangement is similar. I have no idea if the replacement procedure is the same. I am not an electrical engineer and I'm no 'qualified technician' but ACOM's instructions were detailed and clear. It is not a trivial operation as there is a bias adjustment, etc. but the amp's automation and the clear instructions made it very doable.

Again, not sure if this experience translates to the 1000 but I can tell you the folks at ACOM are top-notch in their commitment to customer support. They WILL help you through any problems you may have.

Go for it - you won't be disappointed!

Hi All,

Just took delivery 1 week ago of 2 acom 1000's and they are virtually silent, very easy to use, modern appearance and amazing build quality... previously owned Tl922(expensive tubes), Ic2kl(noisy) and Fl2100z(old shack warmer)...
Bought the Acom's to use on H/F and Six... very unique!
Could spend as much on 6m only amp! We are very happy with our purchase.

Hi Frank, the Acom 1000 is a really sweet amp. It will easily run the power you want (I have to put it that way cos of UK regs!) It is very quiet, both from the fan and relay switching. In fact the Ft1kMP relay is noisier.Using the solid-state switching on the MP and the protection system on the Acom will produce very effective and quiet QSK keying. (I am just about to install that wiring now).

Band changing is very quick and the LCD readout gives you lots of things to check when contact rate drops(!)

I haven't needed to change a tube yet!

I love it. 73 Chris G3SJJ (G8D in CQWW)

Service from ACOM is slipping. Started a conversation on 9/10/02 about getting a new fan for my ACOM2000A. Unit was out of warranty so buying it was not a big deal. Had to send multiple e-mails to get a response about my request. Got the fan....wrong one. ACOM sent the fan for the 1000A not the 2000A. I was very specific about what I had and even provided the serial number of the amp. They caught the error..finally..and stated the correct fan would be sent. No sign of the correct fan yet. It's been 2 months since the start of this fiasco.

Sorry ACOM....I could have bought a replacement fan from several sources in the US by now and had it installed. Next amp won't be an ACOM. I'll stick to products built in the US and supported by their builders.

It was the main fan for the tubes. Unit started "surging" which is indicative of an impending failure. I am confident of this because I've been around, worked on, kicked, and cussed equipment using these types of squirrel cage fans....:) Hard earned experience...:) I was being proactive in replacing this fan before it failed entirely.

Seems Kooltronic makes a fan that should be a replacement for the oem fan in the 2000A. One "unit" fan/motor construction. Should have sufficient air volume. Size and motor location/size may be a drawback. Checking one out Thursday....and it's in stock just down the "road".

904. AA1AC you have an E-Card from Paul.

905. advise from Acom factory

Yahoo group: acom-list (1999 — 2009)
Date: 2002-11-17 19:31:59 UTC
From: iz5asz
Topic: 905 Message: 905

1. DRIVE LED blinks above 80W; trips above 126W. Nominal value is 50...60W for rated output. Reduce drive to overcome the protection.

2(a). FWD-P and RFL-P trip above 203W during standby. Bypassing up to 200W forward and reflected power through the amplifier in STBY and OFF mode is safe. A warning is issued in STBY at 203W threshold to secure amplifier's bypass circuitry safety. With 200W-transceivers you may overcome an eventual warning by reducing the power of about 5-10% or so, when the 203-watt threshold is exceeded accidentally.

Please note that switching off the amplifier does not resolve the problem, as the amplifier only could not tell you that the power is too high for it's bypassing relay, and a risk of a damage still exists with more than 200W. If you need more power with the amplifier off, you should reconnect the input and output cables leading to the amplifier, in order to take it out of any transmitting path for more than 200W.

2(b). RFL-P trips above 502W during operate. Typically a no-load condition or wrong antenna selection after a band change is the cause.

3. IP LED: blinks above 1.4A plate current; time-lagged trip at 1,6A for 4 seconds; instantaneous trip above 2.4A. Reduce drive to overcome it.

Nominal plate current is 0,95...1,25A, and may vary slightly depending on mains voltage, band, and tuning quality. Idling current is set at the factory to 50mA / 375mA (keyed with no RF / small RF applied), for minimum IMD.

4. IG2: nominal value of the screen grid current is 60...80mA, but it widely varies with mains, tuning quality, and different tubes. An acceptable range is 0...100mA is acceptable. Protected by hardware at 120mA and by software at 200mA for 20ms time lagged. Reduce drive to overcome it.

5. IG1: nominal control grid current is 5...10mA, trips at 20mA for 20ms time lagged. Reduce drive to overcome it.

The ALC signal is grid-current derived. When the control grid (G1) current appears during transmission between zero and 5mA (both tubes summary), the ALC voltage is zero. When this threshold is exceeded, a negative voltage appears on the ALC output, which is linearly proportional to the amount of grid current above the 5mA threshold. Its maximum value (-11V) is reached around 15mA grid current, and can be continuously reduced to zero via the ALC regulator. The regulator is located on the rear panel, just above the ALC connector. Clockwise

rotation will increase the maximum ALC voltage (and the loop gain of the system "amplifier + transceiver"). Using this output is normally not needed with modern transceivers.

The electrical parameters of the ALC output are as follows:
- maximum output voltage (negative to ground) up to -11V;
- output resistance about 500 Ohms;
- maximum output current up to -10mA (self-protected).

6. Concerning the "HEATER" LED indicator you may need the following information:

If "HEATER" indicator lights continuously, probably mains voltage is lower than the nominal. If it often blinks (twice per second), mains voltage is higher. You may still work safely even when "HEATER" is lit, as this is a warning indication only, but the protection threshold is yet close. If even more severe mains voltage deviation occurs, the auto protection would trip, the red "PROT" LED will flash, and an appropriate text message will be issued on the LCD.

In order to determine how close are the trip conditions, you may enter the MEASURE sub-menu and monitor the following values:

- MAINS (line input voltage, no protection is directly derived);
- FIL-V (filament voltage, 10V to 14.4V is acceptable);
- IF-REAR (filament current - rear tube, 3A to 4.4A is acceptable);
- IF-FRONT (filament current - front tube, 3A to 4.4A is acceptable);

The heater voltage protection would trip at voltages below 10V or over 14.4V, and the corresponding message to the operator is issued on the RCU. Respectively, the thresholds for heater current protection are 3A and 4.4A, and appropriate messages appear when tripped.

For your information, the nominal filament voltage is 12.6V, and the nominal current is 3.6A. The "HEATER" indicator on the RCU is normally dark. It will light constantly if the filament voltage drops below 11.6V, and it will frequently blink if the voltage exceeds 13.6V (in order to inform you that nearly half of the acceptable range is crossed). In both cases the voltage selection may need to be changed if this conditions predominate. See also p.11 below.

7. Exhaust air Temperature. The optional external fan (when mounted DC type) is accelerated at 90deg.C, and is slowed down after the exhaust air temperature drops below 80deg.C. Full temperature scale on the RCU (up to 130deg.C, 10 degrees per bar) is acceptable. A ">" sign appears when the scale is overflowed, and a protection trips at 150deg.C threshold.

If the temperature is higher than 80deg.C at the moment you switch the amplifier off, the tubes are instantly powered off, but the blower would continue cooling, until the exhaust air temperature

drops below 80deg.C.

Another protection system monitors the air motion in the tube deck volume. This would prevent the control system from being let down, while measuring a low-temperature but still-standing air above hot tubes. You'll get a "LOW AIRFLOW" message in such conditions. Check whether the inlet / outlet cutouts of the amplifier chassis are not accidentally covered by alien subjects, and let the tubes get cool. Clean or replace the air filter. Add the optional external fan in severe temperature conditions, and for continuous modes of operation (please contact ACOM for installation instruction).

8. DC supply voltages:

Template:
rated V: +/- tolerance (protection thresholds); what is supplied.

+5V: +10/-15% (4.25...5.5)V; logic and analogue circuits voltage.

+/-12V: +15/-15% (10...14)V; analogue and RS232-port voltage.

+24V: +27/-30% (17...30.5)V; power-on relays voltage.

+48V: +27/-30% (34...61)V; antenna and input relays voltage.

+12/340V controlled screen grid voltage. Typically 10...15V during standby (EG2 is off), and 320...350V during operate (EG2 is on). Protection thresholds: if more than 40V during standby; if less than 150V or above 430V during operate.

+2850V plate voltage (no load condition): +15/-55% (1280...3300)V; 2300...2500V is nominal at various loads and mains internal resistance for rated output.

-124/-75/-52V controlled bias voltage. Typically -115...-130V during standby / -70...-80V during operate idling / -45...-60V during operate with RF applied. Adjusted at the factory during setting of plate idling currents for minimum IMD (see p.3 above). Protection thresholds: if less than -100V during STBY; if less than -35V during OPERATE.

9. The following quantities are calculated on the base of directly measured parameters:

- DC INPUT is calculated from (HV x IP); no protections from DC INPUT are derived.

- GAIN is calculated from (FWD_P / DRIVE); a "LOW GAIN" protection is derived at a threshold below 10dB gain.

- VSWR is calculated from Gm =(RFL_P/FWD_P); VSWR = (1 + Gm) / (1 - Gm); no protections derived.

The used above HV, IP, DRIVE, FWD-P, RFL-P, the 12 remaining parameters listed in S.4-3, p.19 of the Operating Manual, and also 4 more supply voltages, are directly measured via the ADC (analog-to digital converter) in the CPU PCB. Multiple protections and tuning criteria are based on this information.

10. In addition of the above listed, a variety of values are checked dynamically while the amplifier's status is being changed, thus more than one protection may trip if bad conditions are detected. For instance, the heater current peak, HV, and EG2 are differently controlled during the power-on period, or while changing from standby to operate and vice versa. Also, the input and antenna relay contacts time performance is monitored at every dot/dash keying, and RF appearance.

11. Mains voltage tolerances.

See S.7-1j on p.29 of the Operating Manual. Normally, a +/-10% excursion of nominal tap voltage is acceptable. For instance, this is 216...264V with 240V nominal. The amplifier would work up to +/-15%.

If you however exceed these thresholds (below 204V or over 276V for 240V nominal), supply voltages and/or currents may reach dangerous values. No protection is directly associated with the mains voltage, but nearly all supply voltages (and some currents) would reach their protection threshold values, so various amplifier protections would begin tripping, in order not to let any damage in both: power supply, or the tubes.

Anyway, the control circuit is happy even at a voltage drop of-20%, i.e. below 190V, with 240V nominal tap selected. If mains voltage drops still further (below -25%), the control circuit in the RCU immediately switches off the amplifier, and becomes inoperative, until the voltage restores to at least -20% of the nominal, i.e. at least 190V will be needed to start up at the 240V tap selection. This hysteresis is intended to reject unusable ON/OFFs and RCU restarting, if the mains voltage is frequently fluctuating near the lower acceptable limit.

A controllable step-up / step-down tap-transformer (for 20A nominal current) would be a good solution in low mains conditions, not only for the amplifier. You may find also suitable automatic AC voltage regulators on the market.

12. An additional possibility is foreseen in order to compensate partly for any mains voltage deviation, not to affect the tubes plate efficiency. This is the DEF sub-menu in the OFF menu (see also page 22, 5-6a of the Operating Manual). It is not mandatory to use it, but you have a possibility to optimize the amplifier's performance.

Set the MAINS VOLTAGE menu selection to HIGH, when mains voltage is typically 5% (or more) higher than nominal tap (i.e. higher than 252V at 240V nominal). Set the menu selection to LOW when mains voltage is

typically 5% lower than nominal tap (i.e. lower than 228V with 240V nominal). For still lower voltages, first set lower nominal taps of the transformer (i.e.220V, 200, 120 or 100V). Then observe same rules about this menu voltage selection, respective to the newly selected nominal voltage. Anyway, a voltage of (230...240)V should be considered to be NORMAL with a 240V nominal tap.

Please note that this menu selection does not change any real supply voltage inside the amplifier. It only modifies slightly the plate-load resistance, as a target of the AUTO TUNE procedure, when you match your antennas. With HIGH selection you will request for a higher plate resistance, and vice versa, thus merely doing the best at your real conditions. The result of a new selection however will take effect only after you would make a new AUTO TUNE.

A HIGH selection (higher plate resistance) would lead to higher plate efficiency, higher power gain, less maximum output and longer tubes expected life.

Lowered load resistance (LOW selection) increases maximum undistorted power, but also increases the tubes plate-current use and plate dissipation, so tubes expected life is shortened drastically. Also, the amplifier's power gain is decreased and you'd have to use the transceiver at much higher output.

C A U T I O N: do not select "LOW" default selection unless your mains voltage is really low since tube cathodes will be exhausted VERY FASTER, while 10% more/less power does not make a difference in the air.

We generally recommend for the LOW-NORMAL-HIGH mains voltage selection to correspond to your real mains voltage situation. Particularly, you may select the "HIGH" position regardless of the real voltage value in order to spare tubes, if you don't need the full output power.

Massimo, please feel free to contact ACOM again whenever you need.

910. Some info for ACOM.Co

Yahoo group: acom-list (1999 — 2009)
Date: 2002-11-30 11:24:45 UTC
From: Andy Fyodoroff
Topic: 910 Message: 910

Hi guys!

I have excellent "ACOM-1000" and this PA working fine.
Just one remark for ACOM.Co
In my area very often power plant station switched off the
electricity. During QSO the tube temperature increases up
to +80c! Certainly , this situation is very bad for final PA tube.
Probably reason for the future to installing additional capacitor for
the FAN to cooling tube during the power (electricity) problem.
like in ALPHA PA's.

Best regards!

73 de YU8/9X0A Andy

911. Turn amp on and off, or leave on?

Yahoo group: acom-list (1999 — 2009)

Say it's a weekend, and I'm in and out of the shack. I may work some
DX in the morning, then come back late afternoon, etc.

Is it better for the amp/tubes to just leave the amp on all day, or shut
down and turn it back on later in the day, if needed?

Interested in your opinions...

Barry,
I have heard both opinions. I think Krassy once posted someting that ALLUDED that it is best to shut down and I did for a long while. Most recently I began leaving the amp on all day in the situation you describe. My tubes have 3 plus years without any indication of a decrease in output or change in operating characteristics. I too would like a more definitive answer based on hard facts but it is possible the differnces may be slight or non-existent. Possibly this will attract some more opinions.

Maybe it□s an old habit form the big old tube days, but I leave the amp on
all day, if I think I will be on the air that day. Most days it is not on as
I usually don□t need it to get in a pileup, unless it□s the low bands.
Curious as to the feedback you get Barry.

Recently I read the instruction manual for the 2000. As I recall, it said to shut the amp off from the keypad if you weren't
going to be using it for a half-hour or so... and to turn off the power switch on the front of the amp if you were not planning to
use it in the next few hours.

My memory is imperfect... but I'd start by looking for information in the instruction manual. And tell us what you find:
obviously we've all forgotten since our first exciting day unpacking the Beast!

So someone actually reads (and remembers) the manual!

I don't know if there's more than one edition, but it does say on the
bottom of page 15 of my manual:
"In order to turn the amplifier off, press the red button on the RCU. If
you are not going to use the amplifier for a long time (more than 30
minutes), it is best to turn off the amplifier using the Main Power switch
(on the main amplifier chassis) as well."

But why? I think people are searching for reasons. My XYL has a
whole bunch of "rules",(i.e. one doesn't wear white till June) which
don't have a basis.

I would be curious to hear from Acom why they recommend turning off the main power switch. As they also sell RCU extension cables, they must know that the amp will not be easily accessible in all cases. Also, would like to know why they recommend turning off the amp if not in use for more than 30 minutes.

919. FWD: RE: [acom-list] Turn amp on and off, or leave on?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-12-02 12:31:20 UTC
From: Jim Idelson
Topic: 919 Message: 919

I UNPLUG my Acom 2000 when I am away from the radio room for any significant period of time. Why? A couple of years ago,
we had some powerful thunderstorms roll through . . . and as the power to the house was going down, it went on/off rapidly and destroyed some electronics in the 2000. The amp was not powered up from the RCU, but the main front panel power switch was turned on. This probably would not have occured if the front panel switch had been turned off. But, after a lot of lightning problems, I am now very conservative - disconnecting most antennas most of the time, running computers on a UPS, etc.

From: Larry Riley
Topic: 919 Message: 920

After reading the manual I tend to turn the amp off at the back when I am done for the day. Not very often do I leave it turned on on the back and simply turn the amp off using the front. Seems with the back on there is power to the micro board and maybe to other components.

So someone actually reads (and remembers) the manual!

I don't know if there's more than one edition, but it does say on the bottom of page 15 of my manual:
"In order to turn the amplifier off, press the red button on the RCU. If you are not going to use the amplifier for a long time (more than 30 minutes), it is best to turn off the amplifier using the Main Power switch (on the main amplifier chassis) as well."

Actually, one may wear white on Memorial Day until Labor Day. There is no logic; it's just a USA social convention... valuable
because it gives one something to flaunt, when the occasion arises where one wishes to go against convention.

The Acom and fashion list?

BTW, let's not forget the exception to the rule - if you live in FL and are playing shuffleboard, white is OK year-round :.)

926. 2000A to 2000S interconnect

Yahoo group: acom-list (1999 — 2009)
Date: 2002-12-03 01:47:05 UTC
From: N1EU
Topic: 926 Message: 926

I'd appreciate info on the proper RS-232 cable to connect the 2000A and 2000S antenna switch controller. Not too clear from looking at the online manuals. Is it DB-9F to DB-9M, null modem (not straight thru)?

Thanks & 73,
Barry N1EU

927. FW: [acom-list] 2000A to 2000S interconnect

Yahoo group: acom-list (1999 — 2009)
Date: 2002-12-03 02:49:50 UTC
From: Jim Idelson
Topic: 927 Message: 927

Barry,

You probably don't know the significance of your question. Many an Acom user has succumbed before finding the correct answer to this seemingly simple question.

The cable is technically a null-modem type. But . . .

DO NOT USE AN OFF-THE-SHELF NULL-MODEM CABLE!

So-called null-modem cables you buy in the store have extra wires connected that will cause your 2000A to MALFUNCTION!

BUILD this cable and it will work:

DB9F-to-DB9F
Pin to Pin
2 3
3 2
5 5

3 wires only.

Doing this will allow you to keep some amount of your hair a little bit longer.

73!

Jim K1IR

928. Re: Turn amp on and off, or leave on?

Yahoo group: acom-list (1999 — 2009)
Date: 2002-12-03 16:56:08 UTC
From: dickgreen03755
Topic: 911 Message: 928

I asked the Acom factory about this a while back. Here's the answer:

Hello Dick,

I have received your question via Krassy. I'm glad that the amplifier is repaired.

There is not a technical problem for 2000A to work all the time with the RCU powered (on duty). The recommendation in the manual is not related to any special regime of the parts inside the amplifier but is a general safety recommendation.

Only the RCU microprocessor system is live at that time and its consumption is less than 0.5 Watts. Also, the LV rectifiers for +/- 12V, +24V, +48V, and -125V are powered, but there is no consumption there until you press the red ON/OFF button on the RCU. The HV transformer primary, High Voltage, Screen Grids Voltage, Motors Voltage, and Heaters Voltage are off.

The CPU (the microprocessor system inside the main unit) is not powered at that time, so you cannot turn ON the amplifier via a command via the serial port. It is necessary to make an additional connection to remotely power ON the CPU. This is described in the technical CD.

On the whole, it is safe for the amplifier to leave the main power switch ON all the time.

Best 73! Vasco, LZ1JK Sofia, 12 March 2001

Jim's point about lightning is well-taken, though. For ultimate safety, unplug it from the wall and the coax.

73, Dick WC1M

929. screen voltage error message

Yahoo group: acom-list (1999 — 2009)
Date: 2002-12-10 19:55:22 UTC
From: Eric Scace K3NA
Topic: 929 Message: 929

Hi --

A very odd thing happened to us at W1KM, where there are now two Acom 2000's installed. The Acom's are quite new, with about 75
hours of service. Here is what happened, as best as can be reconstructed by the operator (who was 24++ hours into the WW CW contest
and getting tired)...

-- Some fault occurred, possibly the amp was driven too hard.
-- Attempting to reset the amp to operate didn't work. A message along the lines of "screen voltage on before warm-up over"
appeared.
-- The manual suggested waiting 5 minutes and trying again. This didn't work.

-- The second Acom was later switched off for some reason. When the second amp was switched back on, the same error message
occurred!

-- Even after being off for many, many hours, the amps still display these messages when starting up.

Very odd that this would occur to two different units!

Help?

-- Eric Scace K3NA

932. Kilovac Relay rf pinouts

Yahoo group: acom-list (1999 — 2009)
Date: 2002-12-13 23:13:37 UTC
From: N1EU <n1eu@yahoo.com>
Topic: 932 Message: 932

Would appreciate it if someone could identify which of the 3 large terminals and 1 small terminal on the rf side of the Kilovac HC-1 relay is common, n/o and n/c? Alternately, just a visible description of which 2000A rf cables are connected to which terminals on the HC-1 would do the trick. Some amps have a colored Russian relay, but I need info for the Kilovac.

Thanks very much for any help & 73,
Barry N1EU

I had exactly the same problem with my 2000A shortly after I bought it.
It was a defective relay. Krassey sent me a new relay and also
instructions on how to replace it. It is not as easy as one might
first believe, but it isn't terribly difficult either. Contact Krassey
and I'm sure he can help you.

Topic: 938 Message: 938

So I've been getting the infamous "arc fault" msg. from my amp. Did a search of the forum list and took some ideas and follwed them thru., i.e. new coax, new connectors, etc. Now here's the head scratcher....the amp works just fine on any band I pick one day and the next day it starts arc faulting again. Works fine again, starts faulting again. Weather has no effect,etc.

I've varied drive levels, set usr def. tunings, etc....no difference, still faults one day, works the next!! So anybody have any suggestions?? Is this behavior a sympton of something else failing in the amp? When it's working I get out like gang busters....:) It's a little disconcerting to be in the middle of a conversation that's been going on for a while and have the amp decide to arc fault. No pattern here I can see, ie drive power, weather, moon phases, star alignment, etc....:)

Suggestions????

Usually, the arcing is on your antenna, or in your antenna system somewhere.

I would look there for the problem first.

Yep I thought of that. I've replaced every chunk of coax and the connectors with tested good cable and connectors. The only piece I haven't replaced, yep you guessed it, is the piece running from the antenna down to the hardline...:) I'd replace that but the wind here in N. Colorado at the moment is blowing hard enough to move small farm animals...:) Hanging up in the air while that is going on is not my idea of a good time...:) If it's in the hard line I'll be suprised since that tested perfect during the install and subsequent sweep tests. It's always the "piece" at the end of line isn't it...:)

I go along with Bob's idea ... What kind of antenna do you use, traps, linear loading, matching type ?
It's possible that where the mechanical connections are, high voltage occure, or plastic insulation is used that moisture, water, even high voltage causes the antenna to arc ...

A friend of mine had his KLM KT34XA linear loading elements on the driver arcing the same way without any pattern.
It's almost like 'heating' up the damn thing and after a while the antenna can't handle the power anymore ...

G.L. in finding ur fault ...

I have a Force12 XR-5 antenna. I would agree with the "mechanical"
connection problem. I suspect, can't prove it until I climb the
tower, that it is the coax running into the anntenna balun from the
hardline connection down below. It could very well be the pl259
connector or the N connector at the hardline junction. Nothing like a
"little" power to show up bad "connections".....:) High quality cable
used through out the setup by the way, i.e. Bury flex and commscope
hardline. Gold center pin, silver plated, teflon insulator on both
pl259 and N connectors. All soldered, no crimping involved....learned
my lesson on that...:)

You didn't say what type of connectors your are using. Or if it is
only on one antenna.

If UHF:

Disassemble all UHF connectors and look for carbon on center pins or
in the female recepticle.

The newer UHF connectors don't seem to have the mechanical spring
force that older ones do. Also there are some UHF male connectors out
there with undersized center pins.

If the connector pulls apart very easy, it's a possible source of
problem.

Also look at any other stuff connected between the amp and antenna
(antenna switch boxes et al). The chassis mount UHF connectors that
are attached with a nut can be a problem. They not only suffer from
lack of spring force as above but can become loose or corroded at the
nut.

If type N connectors:

The older type connectors with non-captive center pins suffered from
the center pin pulling out. It can happen through mechanical cycling
or from heat/cold cycles. It doesn't take much to have a problem.

If you can find a high power dummy load somewhere, put it at the
feedpoint and see if the problem occurs. If so work backwards from
that point until the problem goes away.

Another possibility if you have multiple antennas with multiple
feedlines and only one antenna exhibits the problem. Swap feedlines.
You might be able to narrow it down to a feedline problem or an
antenna problem.

Real hams don't do antenna work until after the snow flies.

It could be the vacuum relay.

In my case, the 2000A faulted with either of two completely separate
antennas and feedlines.

I would contact Acom if you haven't already.

Your "arc fault" problem sounds so very familiar to me. When I took delivery of my ACOM 1000, I was immediately plagued by arc faults, which occurred in the same random (moon phase) manner, which you describe.

During troubleshooting, Krassy passed my problem to Stan, LZ1IU, at the factory. Stan is unbelievably helpful as a remote (email) troubleshooter. By reporting fault codes to Stan, and by running the tests he prescribed, Stan decided that the problem was a defective vacuum relay. Ever since I replaced the relay, I've never seen an arc fault.

Hoping that this might be a new clue. Good luck & seasons greetings.

It could be also the tranceiver. I had similar problems, with a semi random occurrence of 'arc fault' messages when swithching to 30m and 40m, in both cases with antennas having excellent SWR.

It turned out that something deteriorated in the tranceiver, the output waveform was such as not to be correctly measured by the frequency detection in the amplifier. Result: the amplifier did not switch to the correct settings for the output circuits and instant 'arc fault' protection.

I tried a different (and newer) tranceiver, and everything worked fine.
Hope it will be of some help.

Best Christmas wishes,
Giorgio, I2KMG

Would appreciate any advice in avoiding the "detected rf power at wrong time" fault. I'd like to occasionally use my Corsair with the 2000A on ssb. With the Alpha, I just connect the Corsair's t/r relay output to "key in" and it works fine. The Acom faults with this connection scheme. I also ran a footswitch into the Acom's "key in" and then ran "key out" to the Corsair's PTT with similar results.

Any suggestions appreciated.

73 & Happy Holidays,

Would appreciate help troubleshooting AcomTools running under WinXP with WriteLog 10.36. Is the interconnect a standard straight-thru RS-232 cable that uses the RCU connection on the 2000A? I'm using COM2 and I know the port is working. But I can't get any readings from the 2000A and I also get messages that AcomTools can't communicate with WriteLog. Not much offered in the Help file or on the Web so I'm hoping someone on the reflector might shed some light.

Thanks & happy holidays,
Barry N1EU

AcomTools doesn't work correctly with XP. Sometimes it communicates
with WL, sometimes it doesn't. It never reads the power correctly, as it
does on Win98.
From what I've heard, the original author is no longer involved in it, so
don't know if it will ever be fixed. Too bad...

953. ACOM Customer Service- a testimonial

Yahoo group: acom-list (1999 — 2009)
Date: 2002-12-31 07:50:51 UTC
From: Jim Movius
Topic: 953 Message: 953

Greetings,

Purchased an ACOM 2000A, Ser. No. 990147 from FinnFet in Finland in early 1999, prior to sales and service in the US. Warranty at time of purchase was 1 year. In February 2001, 2 of the 3 heater circuit MOLEX connectors failed. Vasco at Sofia, explained that early units had bad connectors, advised of a hard wire repair, and mailed 3 sets of good connectors as replacements. The hard wire repair was accomplished prior to receipt of the connectors, and the amp worked without fault until Dec. 2002 when it intermittently tripped off or failed to start up, giving a low bias voltage message. Running time for the amp was 1826 hours.

To make a long story short, after some diagnostic work and talking with Krassy and Will at the MA facility, the amp was sent to them and they replaced the low voltage board and all 3 sets of heater MOLEX connectors, and tested the amp--all at no charge for the repairs. On the first start-up after return just one day shy of 2 weeks after sending it off, the same low bias voltage message recurred, and the tubes were replaced with spares purchased from Vasco in 2001-my guess, and this is only a guess, is that there was an intermittent tube fault which initiated the trouble.

So far so good with 10 hours on the new tubes.

The service "above and beyond" the published warranty at time of purchase was exemplary--per Krassy they treated it as a 4 year warranty. Their help (Stan in Sofia even lent a hand via email) is most appreciated and worthy of note by all on the acom-list. As far as I am concerned, ACOM has established the "Gold Standard" for service after the sale.

Happy New Year to all from Fairbanks, Alaska where as this is written it is clear and -29 F.

Jim, KL7JM

HNY to all of you!

Even here in Spain where we have no Distributor (as far as I know), we always had an excellent response from Acom (Sofia) or FinnFet.
I had the same problem as Jim and always found solutions in a very short period of time.
Congratulations to Acom's Service.

Before I contact Dealer etc.. Needed to find out if these are actual problems with my amp or whether it is "user error"

Firstly, the amp has had very little use.. Perhaps 40 hrs total at most

Can anyone confirm if they are supposed to buzz loudly on operation (when TX) ?.. It is more of a buzz than a hum, sharper sounding. I'm not talking super loud but it is noticeable. It's like a 50hz hum but much more bee/wasp sounding & more apparent on some bands rather than others.. Both HF6V & beam here are very well matched to 50 Ohms so I never see a high VSWR at the amp. I operate the amp through a Spike/RFI Filtered multiplug capable of giving 13amps but it is the only thing plugged into it. I measured the main voltage this morning 241+- 1V over the 5 mins the meter was connected.

Secondly, at random intervals during operation, the power meter shoots up to full power for a few milliseconds.. Just long enough for me to notice it before resuming normal operation. Monitoring it on another radio there is no change to the signal quality or level. It becomes more apparent at higher power levels but does it when I am driving it to produce just 120W out as well. My First thought was Arcing at the antenna , especially the HF6V but I have checked it & seemed fine. This observation also applies when using my doublet & beam. I've tried my TS850 / FT920 / FT847 to drive the amp but the same thing happens.

Neither problems cause any error message to be displayed on the LCD & it does not trip.. I have not looked to see if there are any error codes stored yet. Perhaps this is the next step but I wanted to see if anyone else has observed these things.

Regards

Rob MW5EPA

The Acom 1000 is nearly silent under normal circumstances. I used one in a contest environment running the maximum power level for 48 hours straight at V26B in 2001.

I would try to determine where the noise is coming from when you transmit. Is it actually in the amplifier? Is it in your RFI Filter ? If it's in the amplifier, can you hear where in the amplifier the noise is coming from? Locating it would help in identifying the cause.

957. RE: ACOM 1000 Problems?

Yahoo group: acom-list (1999 — 2009)
Date: 2003-01-15 12:35:43 UTC
From: mw5epa <mw5epa@btinternet.com>
Topic: 957 Message: 957

Ok, after spending a couple of hours trawling through previous messages about Arcing faults, It's seems the second problem I have sounds so simular except my amp doesn't trip out. It simply has a millisecond as though it's putting out 1025 watts & then the power bar looks normal. When I thought about it , the one thing all my antennas have in common is the fact they all run through a few RG213 patch leads. The Radio is Fed to a LPF then the amp, then the ATU so I will check the patch leads first.. I use H100 Semi-airspaced for the antennas which means I can't actually solder the end of the PL259's since the inner conductor is only just thick enough to come through .. Could this be it?

Hi guys!

Question. Did ACOM has any modifications for "ACOM-2000" after
complains from some HAM's (i.e plastic pins for final tube panel,
bad contacts and etc) ? What type of (Subj) they have ?
Where I can find this info ?

Thanks for reply in advance.

Acom 2000a s/n 000146
la7dfa (jx7dfa)

When were the Molex connectors replaced ?

Would soldering directly on the pins do the job just as well as new connectors (in case of future problems) ?

Please advice.

I got a direct reply from Acom.
They said mine was the third amplifier fitted with the new connectors.
:-)

Krassy,
Can you comment on the progress (if any) of an update for the
AcomTools software to control the amp via computer? As we discussed
by telephone last year, it does not work on Windows XP.
Tnx,
Barry, W2UP

Barry,

During the ARRL DX contest I used AcomTools with Writelog on my XP machine.
It worked great. No problems.

Are you connected to the network? If so ACOM has to start up first,
then attached stuff.
If not it is bad wire in the RCU or connector at back of amp.

Paul,
I agree with Brian. I believe the problem is in the RCU. Probably poor contacts. Try the following:
Open the RCU back cover again. Connect the RCU cable to the amplifier main unit and turn ON only the mains switch on the front panel.
With the voltmeter check the voltages on pins 1-8 of the single-row connector on the PCB back, where the cable is connected. Check the voltages. Only the RCU must be active during the checks (no heater applied).
The normal voltages are:
pin - Voltage:
---
1 - 0V;
2 - nearly zero;
3 - nearly zero;
4 - about +14V (unregulated);
5 - about +11V (unregulated);
6 - nearly zero;
7 - about +3V;
8 - about +0,8V;
2. While monitoring pin 6, turn ON the amplifier from the red ON/OFF button on the RCU. This is the "CPU-RESET" signal from RCU to the CPU. It must stay zero while the CW "TEST" sounds, then must rise to about +5V, one second after the CW "TEST" end. Turn OFF.
3. While monitoring 7, turn ON again. This is the serial data from RCU to CPU (RCU-CPU). It must rise from +3V to +5V at the beginning of the CW "TEST" sound. One second later there must be a short voltage drop and the voltage must return to +5V. Turn OFF.
4. While monitoring pin 8, turn ON again. This is the serial data from CPU to RCU (CPU-RCU). It must rise from about +0.8V to +5V at the beginning of the CW "TEST" sound. Five seconds later there must be a short voltage drop and the voltage must return to +5V. Turn OFF.
Please note that the voltage drop presence as described in (3) and (4) is very important. If your voltmeter is a slow-reading one, you may miss such drop although they were present. In such a case, an oscilloscope would be preferable: a short burst of pulses from +5V to nearly zero, must be seen at that moments.
If you have not an oscilloscope available, a simple but very fast indicator would be small LED (1/8 In diameter). Connect its anode, through a 1-2kOhm resistor, to the pin under test, and the cathode to the chassis. It must normally light (although poorly), and a short fade must be noted at the mentioned moments.
5. The problem could be in any IC socket contacts. To clean them, unscrew the RCU PCB and take it out of the box. Extract the uP chip 80C31 (U3, 44 contacts square case). Note the chip orientation. Clean the chip contacts with alcohol. Make sure that no residual lint has left on the contacts. Look

over the socket contacts, clean them in the same way, and return the chip into the socket. Make the same with the EPROM 27C256 (U5, 28 pins with a sticker on it). Simple job. Just remember orientation of disconnected IC's, etc. GL, Howard...K2HK

969. ACOM 2000A Amplifier for sale

Yahoo group: acom-list (1999 — 2009)
Date: 2003-04-05 17:17:13 UTC
From: Brian, N8WRL
Topic: 969 Message: 969

Thought members of this group might be interested...

I have an ACOM 2000A amplifier for sale. It is two years old but the tubes have been replaced and have less than 10 hours on them. It is in perfect working order and excellent cosmetic condition. I've busted many a pile-up with this baby, and the '30 over' reports from JA in contests is great! I'm really having a hard time selling it but the truth is, it just sits here most of the time! Not much time for operating lately...

You can get all the details on this amplifier at ACOM's site www.hfpower.com. I have all the original packing material and manuals.

I am asking $4300 shipped & insured to CONUS. Please email me directly if you'd like more information or pictures.

Thanks for your time, and 73!

-Brian n8wrl

972. RE: [acom-list] Acom 1000/FT 1000D

Yahoo group: acom-list (1999 — 2009)
Date: 2003-04-20 10:31:01 UTC
From: G3SJJ
Topic: 970 Message: 972

As kindly supplied by Stan LZ1IU. It works very well. Chris G3SJJ

Many customers use ACOM1000 in QSK mode flawlessly, with FT1000MP too. The system is very similar to that used in ACOM2000A. It works OK with all transceivers available on the market, so you could connect it in three different ways:

a) Connect the "TX-GND" phono jack on rear of FT1000MP to the "KEY-IN" phono jack of ACOM1000. Leave "KEY-OUT" of the amplifier unused. Slide the "LIN" switch to point to the "TX-GND" connector on rear of FT1000MP.

This is the simplest way and it works QSK too, but you would not get advantage of amplifier's safety features. Also, the transceiver relay would be clicking thus shortening the reception periods during CW pauses.

b) A second way is to connect the YAESU "TX-GND" signal from pin #2 of "BAND DATA" connector to the "KEY-IN" phono jack of ACOM1000. You can use any superfluous YAESU connector to twin this output like your idea, or make a branching cable. I would prefer a branching cable since it seems easier and also the transceiver would be maintained in an original condition. Leave the "KEY-OUT" phono jack of the amplifier unused again. Slide the "LIN" switch to point to opposite of the "TX-GND" connector on rear of FT1000MP.

This is an intermediate possibility. You would not make full use again, but at least the transceiver's relay would not be clicking.

c) The best solution is to use both signals. The first part of this connection is like the described in (b) above. Inside the "BAND DATA" connector, you should add also a 10kOhm/0,125W resistor, between "TX INHIBIT" and "+13V" (pins #1 and #8). This resistor is needed to activate transmit inhibition function of FT1000MP. When the connector is plugged in, the transceiver will not transmit unless you tie "TX INHIBIT" to GND, or connect it to the own-generated "TX-GND" signal of the transceiver. Then connect the "TX INHIBIT" signal to the "KEY-OUT" phono jack of the amplifier.

With this wiring, the amplifier will be able to inhibit transmission at any risky moment during OPERATE. During STAND-BY mode, and while resting OFF, the "KEY-OUT" is being bypassed automatically to the "KEY-IN" jack of the amplifier (via an internal relay), thus connecting it to the own "TX-GND" signal of the transceiver, in order to permit barefoot transmission without changing connections.

3. The following information is only intended to give some common technical information about ACOM1000 KEY-IN and KEY-OUT signals.

a) The KEY-IN socket on the rear panel is the antenna relay transmit/receive control input of the amplifier (a transistor input).

When in OPERATE, on this input appears a DC signal which must be held to ground to activate the amplifier in transmit. This can be done via a relay contact or semiconductor (transistor or integrated circuit) with suitable polarity (positive to ground).

The electrical requirements to the respective transceiver's output (to control the KEY-IN) are:

- switching voltage (open circuit), minimum 15V;

- switching current (closed circuit), minimum 15mA;

- voltage drop or resistance @ 12mA current (closed circuit / low level), maximum 1.5V/250 Ohm.

The semiconductor output "TX GND" of FT1000MP does exceed all of them without any buffering.

b) The KEY-OUT socket on the rear panel is an extra output signal from the amplifier to the transceiver. It could be used or not to improve the T/R switching process, as well as to increase the exploitation reliability of the amplifier, antenna, and the transceiver too. This output can be used when your transceiver has available the respective input to disable transmitting. For FT1000MP this is the TX INHIBIT input (pin 8 of BAND DATA connector). We recommend that you connect it with a shielded cable to the KEY-OUT of the amplifier.

The output KEY-OUT of the amplifier is open drain circuit and it can tie to ground a positive DC signal. At the moments when the amplifier is ready to transmit this line is held to ground. When transmitting is not permissible, the output is open circuit (for instance when the antenna relay is in process of switching).

The electrical specifications of the amplifier's output KEY-OUT are:

- switching voltage capability (open circuit), up to +50V;

- switching current capability (closed circuit), up to 20mA;

- resistance @ 20mA current (closed circuit), 120 Ohm maximum.

When the amplifier is not powered and also in STANDBY mode this output is directly connected to the KEY-IN socket. Then the amplifier will return the "TX GND" signal back to the "TX INHIBIT" in order to enable transmitting.

In OPERATE mode the KEY-OUT signal will follow the signal incoming on the KEY-IN socket "TX GND" always when the antenna relay is in safe position and will reject transmitting if any risk condition has been detected.

977. Acom tools, SO2R and WriteLog

Yahoo group: acom-list (1999 — 2009)
Date: 2003-05-29 13:43:45 UTC
From: Eric Scace K3NA
Topic: 977 Message: 977

Hi folks --

I made an attempt to get Acom Tools working with WriteLog last week, but wasn't successful. Perhaps someone can provide a few
tips.

Here is the configuration:

-- SO2R station
-- two Acom amps
-- WinXP confuser runs WriteLog and the Acom Tools app.
-- no Acom antenna switching hardware.

Frankly, this is a pretty limited improvement for a SO2R station. The main advantage of the Acom Tool on the computer is that I
won't have to send a dit to cause the amp to change bands... and maybe the Acom control panels can be removed from the operating
position to reduce clutter. But it's a chance to learn something...

Questions:

1. Can two instances of Acom Tools be running simultaneously, each of which talk to a different Acom amp on a different COM port?

2. Should the cable connecting the computer's serial port to the Acom be a straight-through or cross-over cable? I'm not seeing
any successful communication between the computer and the Acom.

Thanks for any tips from those who have used Acom Tools with WriteLog.

73,
-- Eric K3NA

Don't know about the two instances.
Acom Tools works fine on my WIn98 computer, but is flaky on my WinXP computer. Sometimes it partially works (changing frequency works, but power display doesn't), sometimes it doesn't. Some folks seem to have no trouble with XP, per discussion at Dayton

As I recall, you need a "custom" cable using only 3 wires - gnd, TXD and RXD. I have my documentation at home, so if you don't get a more definitive answer by tonite, I'll look up the details, assuming I can find it :.)

Now, who is spreading these rumors? :)

Yes, I am working on a new version. Ya'll will be my beta testers. It'll be freeware... And since I am setting up SO2R at home, I'll be taking a close look at that feature... We will have to see about 2 amps.

Only guarentee on time table is that it will be completely done and ready for the fall season -- hopefully in the next couple of months.

73,

Gerry, W1VE (/0 in Colorado Springs at the moment.)

980. RE: [Acom-list] Acom tools, SO2R and WriteLog

Yahoo group: acom-list (1999 — 2009)

I am ready for beta testing, or even futzing around with a dummy user interface.

It would be great if the screen interface can be quite compact. It doesn't have to look anything like the current Tool. During a
contest, the main things that I look for are:
-- is the amp transmitting close to 1500W?
-- is the reflected power low? (If not, usually an indication of wrong antenna selection or antenna problem.)
-- is the amp on the correct band?

That could be done with a few narrow vertical bars and a text box indicating the band.

But my application is simple because I don't have the antenna switch.

Thanks for thinking about this!

From: Dick Green
Topic: 977 Message: 981

Eric,

AcomTools worked on my Win98 and W2K machines, but doesn't seem to work on my new WinXP machine. FWIW, even when I had it working under W2K I eventually disabled the automatic tuning feature. As I recall, when Writelog's keyboard focus moved back and forth between the radios, AcomTools would send a new frequency to the amp, causing it to retune frequently. This was harmless, but annoying. I think the idea was that you might be sharing a single amp between two radios. For a while I used the manual tune feature in AcomTools, which allowed me to retune the amp without moving the transmit focus and hitting a dit. That was OK, but not a huge help. Now I just move the transmit focus to the second radio and hit a dit to tune the amp.

For those using XP here is something that might help.

http://www.vmware.com/products/desktop/ws4new_features.html

I have not tried it myself (I already run 98 here) but I have heard from some who have and they seem impressed. It allows you to run two different operating systems such as XP and 98 simultaneously (not dual boot) on your computer. I understand that 98 tasks run somewhat more slowly but that usually is not a problem.

If you try it, let us know how it does.

From: Thomas Herrmann
Topic: 984 Message: 984

Given indikation: IG2=14mA; SHOULD BE ZERO
for the first time appeared after RUNNING TIME 4386 hours (wow !!).
It looks like reason is High Voltage HV=2.43kV instead of expected HV=2.850kV.
As a result, UG2 is too high and leads to the given IG2=14mA.
I'm right ??
And if so, what to do ??
Please give me Your experiences.
Thanks & 73 de Thomas, DL1AMQ

From: Thomas Herrmann
Topic: 985 Message: 985

Some days before I asked the list subscribers and ACOM officials for trobleshooting my ACOM2000A.
Today I'm back again with QRO.
I got notable helpfull leadership in trobleshooting by Stan, LZ1IU. Step by step he fed me to recognize a resistor as source of the trouble. Finally, exchange of the resistor took me 16cent only.
That is really a great support by the ACOMers !

Hi Gang,
I see another spammer subscribed to the list to grace us with his important announcement. He's already deleted.

Since this is the second recent occurrence, I've made a change to the list management. Anyone who now sends a subscribe request to the list, will need to be approved before membership and posting privileges are granted. This won't affect anyone already subscribed, and you can still unsubscribe on your own. Hopefully this will keep the list on topic, and the peaceful and quiet place it's been.

Just a note of interest.

While main rig is off for repair, I decided to use my little 250 milliwatt rig to drive the amp.

Suprise! The freq was properly read by the amp and the amp switched to the correct band segment.

This is hardly an efficient mode of operation. 800 watts of DC plate power for 5 watts RF out.

991. Band Data from FT1000x

Yahoo group: acom-list (1999 — 2009)
Date: 2003-07-19 13:04:10 UTC
From: Bruce Sawyer
Topic: 991 Message: 991

A friend told me recently that he had his Acom 2000A connected to his FT1000 through the Band Data connector in such a way that whenever the frequency was changed on the FT1000, then the amp immediately retrieved and loaded the presets for that new frequency. When I asked how he did it, the reference he cited was the well-known set of notes Stan gave on connecting KEY-IN to TX GND and KEY-OUT to TX INHIBIT (see http://www.albany.net/~bg/Yaesu/MPAcom.htm). That, of course, doesn't quite accomplish what I would hope to see, since in this mode the Acom 2000A still requires a signal from the exciter in order to detect a new frequency.

Ideally, I would like to be able to enter a new frequency on my logging program and have that command the rig, then the amp, and finally the Acom antenna switch I have connected. However, that may not be possible, and it well be the case that my friend and I simply miscommunicated on this. (Unfortunately, his shack is 4000 miles or so away from me now, and I wasn't careful to check his cables closely while I was visiting a couple of weeks ago!) If it is possible to do this the way I would like, it would require connections to pins 4, 5, 6, and 7 on the Band Data connector of the Yaesu, and it would also require that the Acom 2000A be able to understand Yaesu's encoding protocol. This doesn't seem likely, but I still would like to be sure. Does anybody know if there is a way this can be done? The specific Yaesu I have is a FT1000MP, but I suspect the pin-out on Band Data is the same for all of the FT1000 series.

Bruce, N6NT

992. Re: [acom-list] Band Data from FT1000x

Yahoo group: acom-list (1999 — 2009)
Date: 2003-07-19 14:01:52 UTC
From: Barry
Topic: 991 Message: 992

Bruce,
There are a few possibilities:

1. If you use Writelog and AcomTools, the amp (and I presume the antenna switch too, but I don't have one. I do my antenna switching using Top Ten Devices boxes) the amp will QSY and retune as soon as a new freq is entered in Writelog, either directly or read from the FT1000D. The only problem is AcomTools was written for Win98 and its performance is a little flaky in XP, at least in my setup.
Gerry, W1VE, is working on a new version of similar software, so he told me at Dayton. Progress unknown...

2. Dave, N3RD (of Top Ten Devices), with the assistance of one of the Acom engineers in LZ, came up with a device to do some custom stack switching at N3RS. He tells me the Acom guys sent him a chip that interfaces to the amps COM port. I don't want to speak for Dave, but I believe he feels there's too small a market to come up with a commercial product here. You may want to talk with him.

Bruce,

Barry is right on the computer program which does what you want.

There is another way.

The band data from the rig can directly drive an antenna switch box. (Choose carefully if you work WARC bands since not all commercial units cover the WARC bands.) I can send you a skematic of the 1 chip decoder (4028) that permits all nine bands to be decoded. Configure the ACOM for antenna 1 on all bands and do the tuning in each segment.

After the first dit or syllable you've got it connected to thee right antenna and tuned. Works great for chasing spots. Connecting the antenna switch to the xcvr guarantees that the correct antenna will be present immediately. It eliminates the need for still another COM port.

Works for me.

Hello Barry,

I am in the process of setting up my new station
at my new QTH. I have a Yaesu FT-1000MP MARK-V Field
and an ACOM 2000A.
I am trying to understand what you are talking about regarding
AcomTools??? My computer is a Pentium III 866 Mhz running
Windows 98se. I will be using a Top Ten band decoder to drive
my SixPak and Dunestar bandpass filter. I have the Yaesu band
data cable from TopTen. I run either CT or Writelog for contesting.
The Acom 2000A is new for me. It will be the first time I am hooking
it up!! Can you explain / recommend the best arrangement for connecting
things up. I will be grabbing spots and also typing in frequencies to
change
bands. I would like the Acom to follow along if possible???
I thought it did that automatically??? That was one of the reasons
I bought the Acom...

Many Thanks in advance for any help... 73, Ted K2QMF

Topic: 991 Message: 995

Hi Ted,
Your setup is very similar to mine - Yaesu radio, Top Ten for
switching antennas and bandpass filters (and stubs), Acom 2000A...

The Acom WILL follow the radio. Traditionally, as soon as you xmit
your first dit or syllable, the amp senses the freq and retunes
itself in about 1 second. What I'm talking about here is the amp
sensing the freq and retuning BEFORE you transmit. This is where
AcomTools comes in. It works only with Writelog. Do your standard
setup for the radio/COM port, Top Ten boxes, etc. You'll need an
additional serial port (3 wires only - TXD RXD and GND - a prefab
serial cable WON'T work) to connect to the amp. This is for
AcomTools to talk to the amp via the serial port. The radio talks to
the amp only via RF freq sensing if you don't use AcomTools. Make
sense? If not, let me know.
73,
Barry

Note that ACOM tools will NOT work if you are running two radios in your contest station.

Hi Ted,
Your setup is very similar to mine - Yaesu radio, Top Ten for
switching antennas and bandpass filters (and stubs), Acom 2000A...

The Acom WILL follow the radio. Traditionally, as soon as you xmit
your first dit or syllable, the amp senses the freq and retunes
itself in about 1 second. What I'm talking about here is the amp
sensing the freq and retuning BEFORE you transmit. This is where
AcomTools comes in. It works only with Writelog. Do your standard
setup for the radio/COM port, Top Ten boxes, etc. You'll need an
additional serial port (3 wires only - TXD RXD and GND - a prefab
serial cable WON'T work) to connect to the amp. This is for
AcomTools to talk to the amp via the serial port. The radio talks to
the amp only via RF freq sensing if you don't use AcomTools. Make
sense? If not, let me know.
73,
Barry

From: Max Martin
Topic: 991 Message: 997

Hi,

I have a Yaesu FT-1000 D and a just buy a new Acom 2000A. I have running the AcomTools and I already made a three wire serial cable, so now I can control the Acom 2000 A from my PC. But, I don't have the WriteLog, I use the Logic5 and CT.
Is anyone making "drivers" for this programs?
Or, I have to use the WriteLog? to profit the pre-band switching.

73, Max - EA1DDO.

Max...

There is a LOGIC reflector, if you were not already aware of it, at
logic@....

I run LOGIC (V6) and an ACOM amp but have not attempted any computer control
of the amplifier, so, sorry but I cannot help beyond mentioning the LOGIC
reflector. Goold luck and 73

Date: 2003-07-22 12:12:41 UTC
From: N2TK, Tony
Topic: 990 Message: 999

Huh? Has this actually happened? That would be a great mod to have 6M with the 2000A. Or is this a dream?

Hi guys,

Anyone knows something about to "activate", "add" or "upgrade" the 6 meters band into the Acom 2000A?

73, Max - EA1DDO.

1001. 2000A Tube holders?

Yahoo group: acom-list (1999 — 2009)
Date: 2003-07-25 18:32:27 UTC
From: k2qmf@juno.com
Topic: 1001 Message: 1001

Hello All,

I have a question regarding the tube holders.
I understand that the gray plastic inserts are
to be removed before using the 2000A.
I am wondering about the white plastic
pieces that are screwed to the top cover
and extend down onto the tubes.
Do they get removed also before using
the amp ????????? The manual doesn't
mention anything about these things....

Thanks in Advance and 73, Ted K2QMF

From: Taddei Massimo
Topic: 1005 Message: 1005

Hi,
has anybody replace the original tubes in the Acom2000a with a set of tubes GU74B for sale in the surplus market at 150 $? for instance, Tom's tube or Anthony Welsh.
Do these tubes work? or better let it go.
I am thinking about to get a spare set.

Many thanks.

73 Massimo

I bought a spare set from Tom when I bought my amp. (~4 years ago)

The original tubes are still working perfectly.

Hello All,

I bought my used ACOM 2000A and it had 3500 hours on the tubes but still full output. I replaced the tubes with ones from Tom and now have 1500 hours or so on them, no problems.

1009. FT1000x BCD output to RS-232 Conversion device

Yahoo group: acom-list (1999 — 2009)
Date: 2003-08-26 10:35:12 UTC
From: ea1ddo
Topic: 1009 Message: 1009

Hi guys,

Anyone knows if the FT1000 BCD output (band info) is possible
to "convert" to a RS-232 ?
To run the FT1000 + Acom 2000 A + Acom 2000 S/SW WITHOUT PC software
control, just hardware.
May be through the FT1000 serial port translate to the Acom RS232 ?

Max - EA1DDO.

1010. Failure at Power On

Yahoo group: acom-list (1999 — 2009)
Date: 2003-09-01 23:21:06 UTC
From: Dave Hawes
Topic: 1010 Message: 1010

My 2000A has just developed this problem upon return home from recent use in the WAE CW contest at N3RS:

When attempting to turn the unit on, at the end of the 150 second warm up, the "Prot" LED flashes, the unit powers down, and I get the following error message:

"BIAS TOO LOW AT POWER ON: -35V"

I realize that the protection threshold is -100V. I doubt that this is an adjustment, but rather that something has failed (unit worked fine when last powered on for the contest), perhaps in the short ride home something came loose in the unit.

Has anyone seen this error message and had any luck in debugging/fixing it?

73 - Dave N3RD

Hi Dave,
Experienced the same problem last Dec. Sent the amp, minus the big
transformer to the he nice folks at ACOM in Mass. and they replaced the
replaced the screen power supply PCB. Accumulated run time at failure was
1626 hours. After repair the amp worked fine at ACOM, but gave me the same
error signal upon return -- Will at ACOM k6nd@... had warned that a
bad tube might still be a problem. Replaced both tubes and all has been
fine ever since. Total time now is 1829 hours.
Best wishes, good luck,
Jim, KL7JM

I was at work today just thinking about the other online when you left hanging there with my fingers in my pussy. I was so pissed. But, I got over it in no time. I had to care of myself if ya know what I mean. I was wondering if you still wanted to meet up and take care of me when Im coming through on my summer vacation. I hope your manhood is a big as you said it was. I want something over-satisfying. I found this other website last nite that has so many more features than the one were on now. It had a free trial so I was like "why not?". So if you dont see me then you know why. Look me up under my new site as "bootiusmaximus" xoxo hope to hear from ya.

If you have a common feedline to the antennas, it could be some corrosion in
a common coax connector. I had a problem similar to this and corrosion had
set in one of my pl-259's on a feedline shared by several antennas.

Carl,
I thought of that but changed everything out. AND it only happens on that band segment 14.000-14.100. I believe it is internal to the amp
